INTRODUCTION

Species Plantarum aims to provide in concise format, and with standardised data fields, basic taxonomic information on the vascular plants of the world, including accepted names and synonyms with bibliographic data, types of names, keys and descriptions from family to varietal levels, geographical distributions, ecological information and other related matters, and to publish it in both hard copy and electronic form.

The format of the *Species Plantarum* is based on that of *Flora of Australia*, with some departures made necessary by the different scale of the project. Initially at least, the series is being edited and published for the Species Plantarum Project and IOPI by the Australian Biological Resources Study (ABRS), producers of *Flora of Australia*.

Treatments are contributed on a voluntary basis. Each part of *Species Plantarum* is intended to provide a complete account of a family, subfamily, large genus or other related taxonomic group. While treatments of small families may be shorter, it is intended that contributions will, in general, cover at least 50 to 100 species. The taxonomy adopted is that of the author, although the family delimitations recommended are initially those of R.K.Brummitt, *Vascular Plant Families and Genera* (1992). The order of taxa within families, genera and species in the *Species Plantarum* is intended to reflect natural relationships, so far as this is possible in a linear sequence.

Maps are provided for each species, or in those cases where infraspecific taxa are recognised, for each of the terminal taxa. Distribution maps are based on those in R.K.Brummitt, *World Geographical Scheme for Recording Plant Distributions* ed. 2 (2001), and the 'countries' adopted are those of Level 3 and 4 of that work. Description of distribution follows the same work, with a two-digit code for regions and a three-letter code for the 'country'. Upper case letters for the 'country' indicate native distribution; lower case letters indicate that the taxon is only present in that 'country' as an introduced and naturalised plant. If a taxon is extinct in a 'country', this is indicated by a dagger. Distribution of species as cultivated plants is not included.

Misapplied and invalid names are, in general, omitted. Journal titles are abbreviated according to G.D.R.Bridson & E.R.Smith, *Botanico-Periodicum-Huntianum / Supplementum* (1991). Book titles are abbreviated according to F.A.Stafleu & R.S.Cowan, *Taxonomic Literature* (2nd edn) Vols 1–7, and *Supplements* (1976–), except that upper case initial letters are used for proper names and significant words. Authors of plant names are abbreviated according to R.K.Brummitt & C.E.Powell, *Authors of Plant Names* (1992).

A separate part, *Introduction to the Series*, provides a history of the project, a glossary, guide for contributors and key to the conventions used in describing distribution. These resources will also be available on the World Wide Web, initially through the ABRS site (currently <http://www.anbg.gov.au/abrs/flora/spplant/spplant.htm>) with links from the IOPI site (currently <http://life.csu.edu.au/iopi/iopihome>) and others.

PREFACE

This volume is the second of a three-part treatment of the Juncaceae.

The co-operative monographic study was completed in the period 1997 to 2000, under grant no. 206/97/0936 of the Czech National Grant Agency. Almost all the current experts in the taxonomy of the family kindly participated in the project, and their expertise covered both the centres of taxonomic diversity and the most intricate groups in the family. The monograph thus presents the cumulative knowledge of the Juncaceae at this time. Some groups received special attention and their accounts represent new revisions (e.g., *Luzula* sect. *Atlanticae*, sect. *Alpinae*, subg. *Pterodes*) or recent revisions were incorporated (e.g., *Juncus* sect. *Caespitosi*, in part, and *Juncus* sect. *Juncus*). The project benefited from an important coincidence: the Juncaceae have been included in recent volumes of important regional or continental floras, either published in 1999 or 2000, or prepared for publication; the authors of several regional accounts participated in our project (including those from *Flora of North America*, *Flora of China*, *Flora of Australia* and *Flora Neotropica*). Despite this, some groups or sections still require a thorough revision in future, and a number of questions remain unanswered, particularly in *Luzula* sect. *Luzula* in China and Japan, *Juncus* sect. *Stygiopsis* and *Juncus* sect. *Juncotypus*.

While the text represents the combined work of many authors, the final version was prepared by JK, and he accepts responsibility for any errors or missing data.

In addition to the authors and advisers, many other botanists participated in solving numerous problems with old literature, nomenclatural problems and geographical distribution. I would like to express my thanks for their generous help. Invaluable technical assistance was provided by Ms Věra Matějovičová. Dr R.K.Brummitt of Kew, the Secretary of the *Flora of the World* project, showed unfailing interest, and without his support the present volumes would never have come into being.

Jan Kirschner

Phylloschoenus Fourr., *Ann. Soc. Linn. Lyon*, sér. 2, 17: 172 (1869), *nom. inval.*

Perennial or rarely annual herbs, caespitose to rhizomatous, seldom mat-forming, totally glabrous, smooth or papillose. Stem erect, procumbent or ascending, terete to compressed. The most basal leaves usually lacking blade or blade much reduced (cataphylls); fully developed leaves alternate, basal and/or cauline, flat (flat side facing stem), not septate, or flat with raised margins and enlarged cells on adaxial surface, or terete either solid or hollow and with or without septa, or laterally flattened (arranged perpendicular to stem) and imperfectly septate; sheaths open, rarely closed and later split, often with distinct auricles at the junction to blade. Bracts leaf-like or reduced. Inflorescence compound, often decomound, cymose or racemose, often anthelate, sometimes congested, or flowers borne singly in drepania with or without a pair of bracteoles below each flower. Flowers bisexual, rarely unisexual; usually trimerous, rarely dimerous. Tepals usually 6, entire, equal or unequal, persistent, green, stramineous, castaneous to blackish, smooth or scabrid, narrowly ovoid to linear lanceolate. Stamens (2–) 3–6, exserted or not so; filaments filiform or flattened; anthers linear to oblong; connective indistinct or slightly apiculate. Ovary sessile; style almost absent to very long; stigmas (2–) 3, filiform, twining, papillose, of variable length and colour. Capsule unilocular, triseptate or perfectly trilocular; seeds many, usually ellipsoid to ovoid; outer seed-coat tight and hyaline to loose, scarious, smooth to reticulate, forming one apical and one basal whitish appendages or not so; inner seed-coat brown, castaneous or yellowish, ±smooth to reticulate. $x = 10$ (many additional secondary basic numbers exist, ranging from $x = 9$ to $x = 25$ at least, the role of agmatoploidy being unknown).

A genus of c. 315 species, almost cosmopolitan, much rarer in the tropics, with major centres of diversity in W North America, the Mediterranean, the Sino-Himalayan region, the Far East, South Africa and Australasia. Of rather marginal economic importance.

JUNCACEAE (*Juncus*)

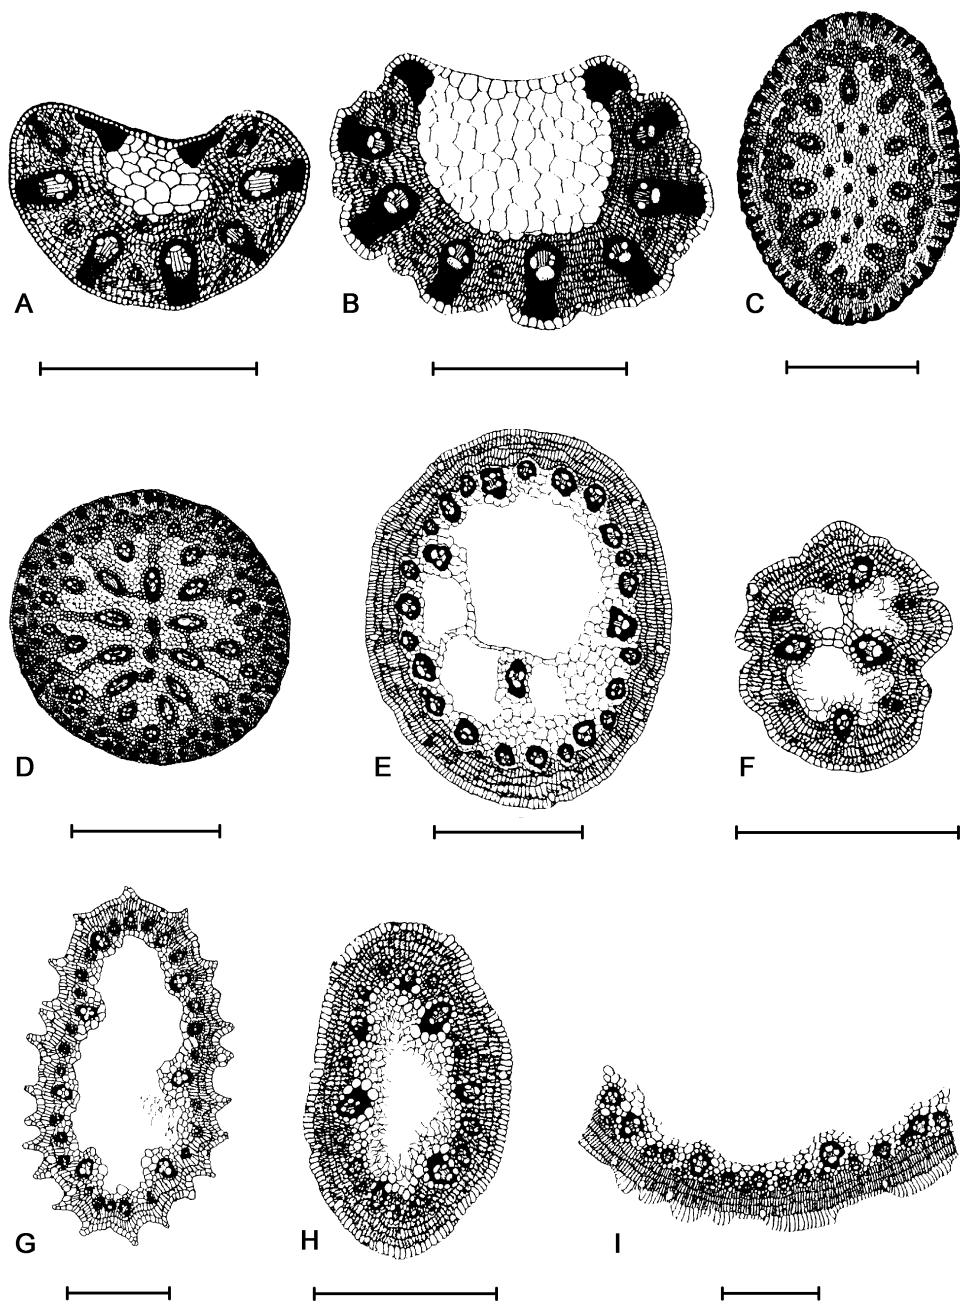

Figure 37. Leaf T.S. of *Juncus* sect. *Steirochloa* (A, B), sect. *Juncus* (C, D), sect. *Ozophyllum* (E, G-I) and sect. *Stygiopsis* (F). (According to specimens from FCO and JAEN). A, *J. capillaceus*; B, *J. imbricatus*; C, *J. acutus* subsp. *acutus*; D, *J. maritimus*; E, *J. subnodulosus*; F, *J. triglumis* subsp. *triglumis*; G, *J. striatus*; H, *J. emmanuelis*; I, *J. acutiflorus* subsp. *rugosus*. Scale bars: A, B, E-I = 0.5 mm; C, D = 1 mm. Reproduced with permission, from C.Fernández-Carvajal, R.Garcia & T.E.Díaz-Gonzales, *Acta Bot. Malacit.* 14: 100 (1989).

KEY TO SUBGENERA AND SECTIONS

- 1 Inflorescence racemose, with the pair of floral bracteoles absent; flowers usually in heads or clusters, rarely borne singly (subg. *Juncus*)
- 2 Leaves terete, stem-like, pungent, basal, not septate; vascular bundles scattered over most of T.S.; lower bract apparently forming a prolongation of stem
sect. 1. ***Juncus*** (p. 5)
- 2: Leaves flat, compressed, canaliculate or if terete then usually septate, not stem-like, basal or caudine; vascular bundles usually in subepidermal position; lower bract usually not appearing as a stem prolongation
- 3 Leaves unitubulose or pluritubulose, perfectly septate; if pluritubulose (not bitubulose) and imperfectly septate, then terete, or flattened but then not arranged perpendicular to stem
sect. 6. ***Ozophyllum*** (p. 151)
- 3: Leaves flat or with raised margins, not septate, or bitubulose and septate, or laterally compressed and pluritubulose and imperfectly septate (then arranged perpendicular to stem), if unitubulose and perfectly septate then with anthers distinctly exserted
- 4 Annuals
sect. 3. ***Caespitosi*** (p. 57)
- 4: Perennials
- 5 Anthers distinctly to at least partly exserted from perianth in later stages of flowering
sect. 4. ***Stygiopsis*** (p. 74)
- 5: Anthers not exserted
- 6 Most of inflorescence not fertile, of golden-coloured feather-like branchlets
sect. 4. ***Stygiopsis***
(*J. ochraceus*) (p. 74)
- 6: Inflorescence usually fully fertile, not of the above appearance
- 7 Leaves laterally compressed, pluritubulose, imperfectly septate, arranged perpendicular to stem
sect. 5. ***Iridifolii*** (p. 135)
- 7: Leaves dorsiventrally compressed or ±canaliculate, not septate, arranged with adaxial flat side facing the stem
- 8 Seeds with two distinct appendages [Sino-Himalayan region]
sect. 4. ***Stygiopsis*** (p. 74)
- 8: Seeds without appendages, or if appendages present then W North America
- 1 Inflorescence cymose, with a pair of floral bracteoles present below each flower; flowers usually borne singly or in loose groups (subg. *Agathryon* [subg. *Poiophylli*])
- 9 Annuals
sect. 7. ***Tenageia****
- 9: Perennials
- 10 Inflorescence seemingly lateral (pseudolateral); lower inflorescence bract terete, erect, seeming to be a continuation of stem; basal leaves bladeless; caudine leaves ±absent; sterile shoots terete, stem-like
sect. 9. ***Juncotypus****
- 10: Inflorescence obviously terminal; lower bract flat, canaliculate or terete, not appearing as a continuation of stem; at least some basal or sub-basal leaves with a well developed blade; sterile shoots not stem-like
- 11 Cauline leaves terete; leaf epidermal cells of the same size; pith of astericiform cells
sect. 10. ***Forskalina****
- 11: Cauline and/or basal leaves flat to canaliculate; leaf blade with at least some cells of adaxial epidermis enlarged, and margins with thin sclerenchymatous strands; inner part of leaves of chlorenchyma, rarely with air channels, not of astericiform cells
sect. 8. ***Steirochloa****

* Sections included in Part II of the *Juncus* treatment.

JUNCACEAE (*Juncus*)

Subg. 1. JUNCUS

Sect. 1. JUNCUS

Juncus L. sect. *Juncus*

Juncus sect. *Acuti* [Fr. ex] T. Marsson, *Fl. Neu-Vorpommern* 454 (1869); *Juncus* subg. *Thalassici* Buchenau, *Monogr. Junc. Cap* 500 (1875) [*Abh. Naturwiss. Ver. Phan.* 303 (1903); *Juncus* sect. *Thalassici* (Buchenau) Vierhapper, in H.G.A. Engler & K.A.E. Prantl, *Nat. Pflanzenfam.*, ed. 2, 15a: 216 (1930); *Juncus* subg. *Juncastrum* (Kuntze) V.I. Krecz. & Gontsch., in V.L. Komarov, *Fl. URSS* 3: 543 (1935); *Juncus* subsect. *Acuti* [V.I. Krecz. & Gontsch. ex] Novikov, *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.*, 95: 117 (1990). T: *Juncus acutus* L.

Juncus [unranked] *Maritimi* Engelm., *Trans. Acad. Sci. St. Louis* 2: 433 (1866); *Juncus* sect. *Maritimi* (Engelm.) Rouy, *Fl. France* 13: 230 (1912); *Juncus* subsect. *Maritimi* (Engelm.) Novikov, *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.*, 95: 117 (1990). T: *Juncus maritimus* Lam.

Juncus subsect. *Roemerianus* Novikov, *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.*, 95: 117 (1990). T: *Juncus roemerianus* Scheele.

Perennials, tall, rigid. Leaves basal, terete, non-septate, pungent; leaf tip sclerenchymatous, sharp-pointed; medulla of rounded cells; vascular bundles scattered over most of T.S.; auricles absent. Stomata in longitudinal furrows. Lower bract apparently forming a prolongation of stem. Inflorescence terminal. Flowers in heads; floral bracteoles absent; peduncles ± incrassated. Stamens 6, rarely 3. Seeds with distinct outer seed-coat forming two appendages or rarely appendages inconspicuous.

- 1 Rhizome short; plants densely caespitose; shoots intravaginal
- 2 Inner tepals with a wide scarious apical part but not notched
- 2: Inner tepals with broad scarious terminal? auricles, apex conspicuously notched
 - 3 Capsule 4–6 mm, with 80–120 seeds; apex conical to obtuse
 - 3: Capsule 2.5–4 mm, with 25–75 seeds; apex conical to pyramidal; if capsule obtuse, inflorescence of several separate dense groups of heads
 - 4 Capsule dark brown; apex pyramidal
 - 4: Capsule pale (rarely dark) brown; apex conical to obtuse
 - 1: Rhizome stout, creeping; stems dense or in elongated rows
 - 5 Seeds 1.25 mm or longer; anthers 3 mm or longer; intravaginal shoots frequent
 - 5: Seeds to 0.9 mm; anthers to 2.5 mm long; intravaginal shoots rare
 - 6 Capsule trigono-ovoid or narrowly so, pale brown; apex usually attenuate or pyramidal
 - 7 Capsule not or slightly exceeding tepals; apex obtuse or abruptly attenuate; anthers up to 2.5 times as long as filaments
 - 7: Capsule exceeding tepals; apex ± narrowly pyramidal; anthers 3–5 times as long as filaments
 - 6: Capsule trigono-ellipsoidal to ovoid, dark brown to castaneous brown; apex usually obtuse
 - 8 Seed-coat forming two small but conspicuous appendages; capsule substantially longer than wide, trigono-ellipsoidal to ovoid
 - 8: Seed-coat tight; appendages inconspicuous; capsule broadly trigono-ellipsoidal to almost globular

1. *Juncus acutus* L., Sp. Pl. 325 (1753)

Juncus acutus L. var. *conglobatus* Trautv., *Trudy Imp. S.-Peterburgsk. Bot. Sada* 5: 480 (1878); *Juncus acutus* L. var. *conglomeratus* Buchenau, *Bot. Jahrb. Syst.* 12: 250 (1890); *Juncus acutus* Rasse *megalocarpus* Asch. & Graebn., *Syn. Mitteleur. Fl.* 2(2): 453 (1904). T: [Europe]; lecto: LINN 449/1, left hand specimen, *fide* S.Snogerup, in P.H.Davis, *Fl. Turkey* 9: 4 (1985).

Map: S.Snogerup, *Willdenowia* 23: 36, fig. 3 (1993).

Perennials, densely caespitose; shoots intravaginal; rhizome abbreviated. Young plants often with some vegetative shoots. Inflorescence of various forms, composed of many (1–) 2–4-flowered often confluent heads. Lower two bracts leaf-like, 3–25 (–40) cm long, including the (2–) 3–6 (–10) cm long sheath; middle bracts with broad amplexicaul base; upper bracts shorter than perianth, ovate, usually brownish-membranous. Tepals ±equal; inner tepals with prominent, scarious apical auricles, notched. Stamens 6, slightly shorter than or equaling tepals. Capsule (3–) 4–6 mm long, with 80–120 seeds; apex subconical to obtuse. Seeds ellipsoidal to narrowly ovoid, c. 20–25-striate, light brown with darker tips; outer seed-coat distinct; appendages distinct, ±equal.

The large, mostly coastal, very disjunct distribution includes the Mediterranean and the Near East, South Africa, Atlantic Islands and NW Africa, Pacific coast of N America from Mexico to Nevada, and temperate South America. Introduced to Australasia. Two subspecies are recognized.

Capsule with conical apex, light to dark brown; inflorescence usually condensed

1a. subsp. *acutus*

Capsule with obtuse to subconical apex, usually dark brown; inflorescence usually lax

1b. subsp. *leopoldii*

1a. *Juncus acutus* L. subsp. *acutus*

4. *Juncus socotranus* (Buchenau) Snogerup, *Willdenowia* 23: 49 (1993)

Juncus maritimus Lam. var. *socotranus* Buchenau, *Bot. Jahrb. Syst.* 12: 258 (1890). T: Socotra, Kisher, 1000–600 m, 29 Apr 1881, *G.A.Schweinfurth* 604; holo: K; iso: WU.

Illustration: S.Snogerup, *Willdenowia* 23: 50, fig. 10 (1993).

Map: S.Snogerup, *Willdenowia* 23: 51, fig. 11 (1993).

Perennials, 80–150 (–200) cm tall, densely caespitose; shoots intravaginal; rhizome short. Stem 2–4 (–6) mm in diam. Basal leaves up to 10, 25–110 cm long, 2–4 mm in diam.; leaf sheaths broad, basally brown, forming a thick cover around the base. Lower two bracts leaf-like, pungent, with longer one 8–25 (–40) cm long including a 4–8 cm long sheath, usually shorter than inflorescence; middle bracts small, amplexicaul, with small pointed blade; head bracts shorter than flowers, ovate, acuminate. Inflorescence (13–) 20–40 × (2–) 5–10 (–15) cm, ± lax, often storied, of (60–) 200–500 or more (1–) 2–4 (–6)-flowered heads. Tepals 2.2–3.0 mm long, equal or with the inner ones slightly longer; margin scarious; outer tepals slightly broader apically; mucro to 0.2 mm long; inner tepals oblong, obtuse, distally widely bordered silvery hyaline and cucullate, not or slightly notched. Bracts and tepals ± conspicuously red punctulate-striulate. Stamens 6, 2/3–3/4 as long as tepals; anthers 1.1–1.7 mm long, (2.5–) 4–6 times as long as filaments; style 1–1.5 mm long; stigmas 1.5–2.5 mm long. Capsule 2.5–3 mm long, exceeding tepals, trigono-ovoidal to spheroidal, abruptly contracted to (0.1–) 0.3–0.6 mm mucro, dark brown, trilocular, 25–35-seeded. Seeds 0.6–0.8 × 0.25–0.35 mm, or 0.85–1.5 mm long including appendages, narrowly ovoid, c. 20-striate; appendages ± unequal. Fig. 42.

Perennials, 50–100 cm tall; rhizome creeping, up to 8 mm in diam., with internode length variable; intravaginal shoots usually lacking. Stem usually 1.5–2 mm thick, rigid. Leaves (10–) 25–80 cm long, 1–3 mm in diam. Lower two bracts leaf-like, with broad sheaths, (7–) 10–25 (–40) cm long, including sheath 2.5–4 cm long, usually exceeding inflorescence; middle bracts with blade reduced to small mucro; bracts subtending heads shorter than flowers, amplexicaul, apiculate. Inflorescence (4–) 10–20 × (2–) 3–5 (–8) cm, usually lax, rarely contracted to one or a few large clusters, with 20–100 (–200) heads. Heads (1–) 2–6-flowered. Tepals with membranous margins, 3–4 mm long; outer tepals ±longer, ovate, cymbiform, acute, with mucro 0–0.3 mm long; inner tepals narrowly elliptic, with ±broader margins apically, obtuse. Stamens 6 (rarely 3), c. $\frac{2}{3}$ as long as tepals; anthers 0.8–1.2 mm long, 1.5–2 (–2.5) times as long as filaments; style 1–1.5 mm long; stigmas 1–2 mm long. Capsule 2.5–3.5 mm long, equalling or slightly exceeding tepals, trigono-ovoid, obtuse or abruptly attenuate, with mucro 0.3–0.6 mm long, trilocular; seeds 60–100. Seeds 0.6–0.7 mm long, 0.8–1.2 mm including appendages, obliquely ovoid, c. 25-striate; appendages unequal, white. Figs 37, 43.

From W and NW Europe (with isolated occurrence in C Europe) and N coasts of the Mediterranean to Turkey and the Black Sea region, Iran and Central Asia. Casually introduced to E USA and Uruguay in the past. 10: DEN, GRB, IRE, SWE. 11: AUT, BGM, GER, HUN, NET. 12: BAL, COR, FRA, POR, SAR, SPA. 13: ALB, BUL, GRC, ITA, KRI, ROM, SIC, TUE, YUC. 14: KRY, UKR. 21: AZO. 32: UZB, TKM, TZK. 33: TCS. 34: AFG, CYP, EAI, IRN, PAL, TUR. 75: nwj, nwv. 85: uru. Most common in coastal to brackish salt marshes, less often in maritime sands and inland saline to subsaline habitats, in Iran up to 1200 m. Map 180.

JUNCACEAE (*Juncus*)

Figure 43. *Juncus maritimus*. **A**, rhizome with a row of stems; **B**, **C**, inflorescences; **D**, flower head; **E**, flower; **F**, tepals; **G**, one-flowered head (right) and flower in fruit; **H**, capsule; **I**, opened capsule; **J**, seeds. (**A**, A.Strid & al. 24277, LD; **B**, **D-J**, S.Snogerup 1445, LD; **C**, E.M.Sennen 5432, LD). Scale bars: **A-C** = 10 cm; **D**, **G** = 3 mm; **E**, **F**, **H**, **I** = 2 mm; **J** = 1 mm. Drawn by B.Johnsen. Reproduced with permission from S.Snogerup, *Willdenowia* 23: 53, fig. 12 (1993).

Perennials, (50–) 75–150 cm tall; rhizome creeping, branched, to 10 mm in diam., with internode length variable. Culms rigid, usually 2–5 mm thick. Leaves 25–110 cm long, 1.5–3 mm thick. Lower two bracts leaf-like, 5–25 cm long, including a sheath 2–5 cm long, shorter than to much exceeding the inflorescence; middle bracts small; bracts subtending heads much shorter than flowers, ovate, amplexicaul, cuspidate. Inflorescence 5–40 × 2–5 cm, lax, usually elongated, with (20–) 50–150 (–300) heads. Heads (1–) 2–4 (–6)-flowered. Tepals 3.5–5 mm long, equal or outer ones ±longer; margins broad, scarious; outer tepals narrowly ovate, cymbiform, acute to obtuse, sometimes with small mucro; inner tepals oblong, obtuse, with margins ±expanded apically. Stamens 6, $\frac{2}{3}$ – $\frac{3}{4}$ as long as tepals; anthers (1.0–) 1.5–2.0 (–2.5) mm long, 3–6 times as long as filaments; style 0.7–1.2 mm long; stigmas 1–1.5 mm long. Capsule 3.5–5 mm long, conspicuously exceeding or rarely equalling tepals, narrowly trigono-ovoid, trilocular, usually straw-brown; apex trigonous, tapering, sometimes abruptly contracted; mucro to 0.5 mm; seeds usually 70–90. Seeds 0.6–0.7 mm long, or 0.9–1.8 mm long including appendages, 0.2–0.3 mm broad, narrowly obliquely ovoid, 20–25-striate; appendages equal or subequal. 2n = 46, 48, *fide* S.Snogerup, *Willdenowia* 23: 57 (1993). Fig. 44.

Common in N Africa, and from scattered localities in W and E Africa. Widely distributed in S Africa. From Cyprus, Syria, Israel, Red Sea and the Arabian Peninsula, to S Afghanistan and S Pakistan, and Turkmenistan in the north. Not found in Europe recently. 12: SAR. 13: ITA, SIC. 20: ALG, EGY, LBY, MOR, TUN. 22: MLI, NGR, SEN. 23: ZAI. 24: CHA, SUD, SOC, SOM. 26: ANG, MLW, MOZ, ZAM, ZIM. 27: BOT, CPP, CPV, LES, NAM, NAT, OFS, SWZ, TVL. 32: KGZ, TKM, TZK, UZB. 34: AFG, CYP, IRN, IRQ, LBS, PAL, SIN, TUR. 35: GST, KUW, OMA, SAU, YEM. 40: PAK. Usually sandy saline localities (both coastal and inland), in desert and steppe regions often near wells, in seasonally wet depressions. Map 181.

7. *Juncus kraussii* Hochst., in C.Krauss, *Flora* 28: 342 (1845)

T: South Africa, George Distr., Notsinakama R., Jan 1839, *C.Krauss*; lecto: G-BOIS, *fide* S.Snogerup, *Willdenowia* 23: 57 (1993); iso: M.

Perennials, c. 40–130 (–200) cm tall; rhizome creeping, short-noded, densely branched. Leaves terete, 20–100 cm long, 1–5 mm in diam. Lower two bracts leaf-like with wide sheaths, usually exceeding inflorescence; middle bracts narrowly ovate, amplexicaul, acuminate, often with a small, distinct lamina; bracts subtending heads ovate, shorter to ±equalling flowers, scarious. Inflorescence usually lax, rarely consisting of a few clusters. Flowers dark. Tepals ±unequal; outer tepals longer, with base and midrib herbaceous, with margins scarious, ovate, cymbiform, keeled, with scarious margin slightly broader distally, very fragile; mucro 0.1–0.3 mm long; inner tepals oblong, subobtuse to obtuse. Anthers shorter than tepals. Capsule 2–2.5 (–3) mm long, trigono-ovoid to trigono-ellipsoidal, usually obtuse, dark brown to castaneous at least in apical part. Seeds with very short unequal appendages.

Disjunct in three areas: Southern Africa, along the S and SE coast to Mozambique; Australia, Tasmania and New Zealand; and temperate South America. There are three subspecies.

Intravaginal shoots sometimes present. Lower bract 4–40 cm long, including sheath 1.5–2.5 (–4) cm. Inflorescence 6–25 × 2.5–6 cm, usually elongated, sometimes conspicuously bipartite, with 50–400 heads. Heads 3–6 (–10)-flowered. Most flowers hermaphrodite, rarely some functionally female. Tepals 2.2–2.8 (–3.3) mm long. Stamens 6 (rarely 3), rarely in some flowers all rudimentary; anthers 0.7–1.2 mm long, 1.3–2.5 times as long as filaments; style 0.25–0.5 mm long; stigmas c. 1.5 mm long. Capsule 2–2.5 mm long, equalling or exceeding tepals by up to 0.5 mm, trigono-ellipsoidal, acute to obtuse, glossy castaneous, trilocular with distinct placental wings centrally; mucro up to 0.3 mm long; seeds usually 15–20 (–25). Seeds dark brown with one blackish blunter end, 0.6–0.8 (–0.9) mm long, or 0.7–1.0 mm long including appendages, 0.3–0.4 mm broad, ellipsoidal to obliquely ovoid, (20–) 25–30-striate, with transverse striae inconspicuous; appendages small, unequal. Fig. 45.

JUNCACEAE (*Juncus*)

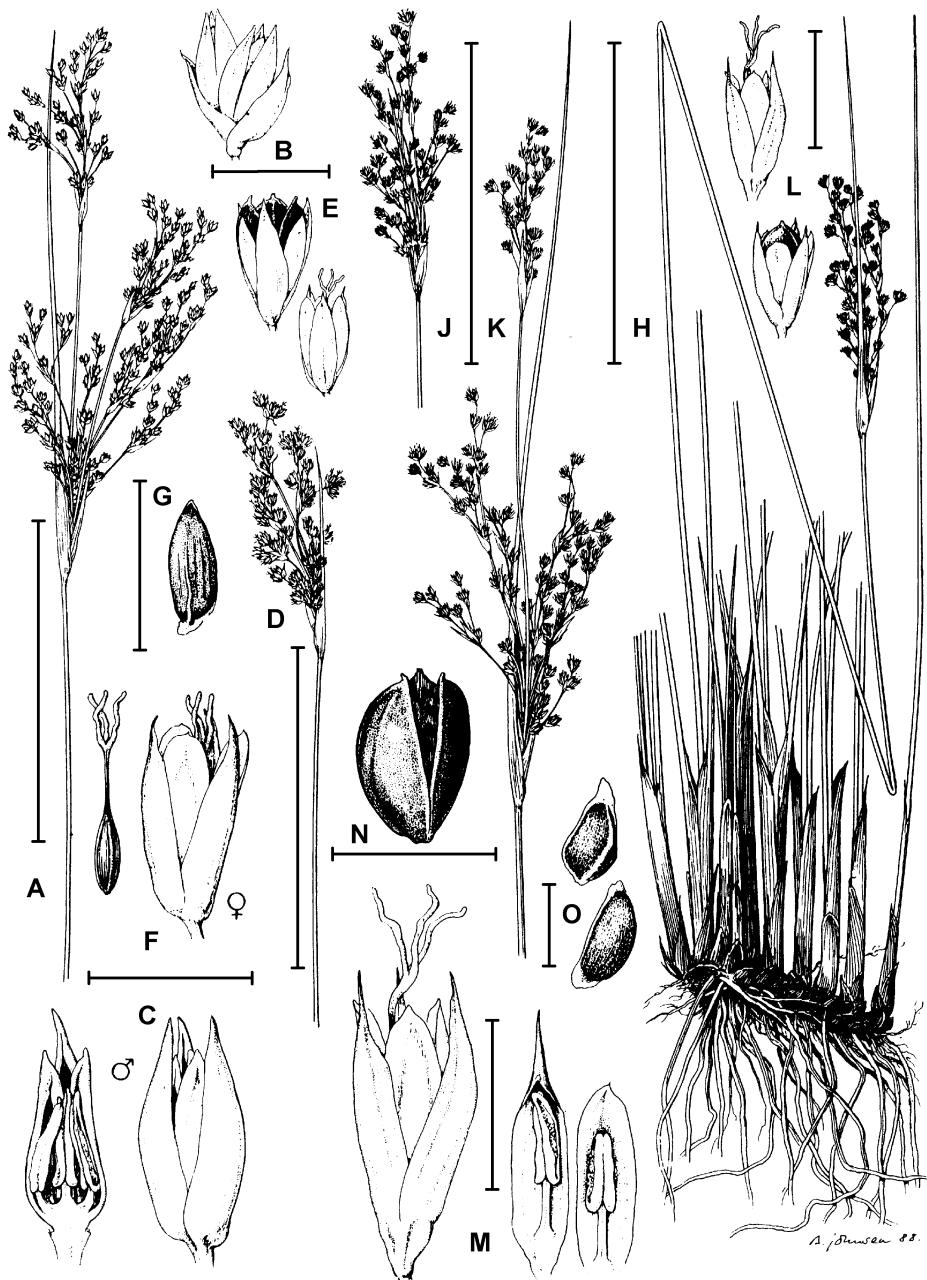

Figure 45. *Juncus kraussii* subsp. *kraussii*. **A**, inflorescences of male individual; **B**, head of male individual; **C**, male flower; **D**, inflorescences of female individual; **E, F**, female flowers at different stages; **G**, seed. *Juncus kraussii* subsp. *australiensis*. **H**, rhizome; **J, K**, inflorescences; **L**, flowers in early flower and fruit; **M**, hermaphrodite flower and tepals with stamens; **N**, capsule; **O**, seeds. 7c. *Juncus kraussii* subsp. *austerus* (Buchenau) Snogerup, *Willdenowia* 23: 63 (1993)

Juncus austerus Buchenau, *Junc. S.-Amer.* 389 (1879) T: Chile, San Carlo, *W. Lechner* 3089; lecto: K, *fide* S. Snogerup, *Willdenowia* 23: 63 (1993).

Illustration: S. Snogerup, *Willdenowia* 23: 64, fig. 19 (1993).

Map: S. Snogerup, *Willdenowia* 23: 65, fig. 20 (1993).

Intravaginal shoots absent. Cataphylls 3–5, pale brown, with uppermost 2–10 cm long, sometimes with a short lamina. Lower bract (3–) 9–20 (–60) cm long, including a sheath 2–6 cm long. Inflorescence (3–) 8–12 × (1.5–) 3.5–5 cm, usually ±dense, with flowers in (15–) 75–200 (–c. 1000) heads. Heads (1–) 3–8 (–10)-flowered. Tepals 2.5–3.5 mm long. Stamens 6 (rarely 3), c. 2/3 as long as tepals; anthers rarely well preserved in fruiting flowers, 0.8–1.7 mm long, 1.5–3 times as long as filaments; style 0.2–0.5 mm long; stigmas 1–1.5 mm long. Capsule 2.5–3 mm long, about equalling tepals, trigono-ellipsoidal to trigono-obvoid, obtuse to acute, light brown to glossy castaneous, trilocular; mucro up to 0.3 mm long; seeds usually 20–25. Seeds 0.7–0.9 mm long, or 0.8–1.2 mm long including appendages, 0.3–0.4 mm broad, ellipsoidal to obliquely ovoidal, dark brown, c. 25-striate; appendages small, unequal. Fig. 46.

Restricted to temperate South America. 84: BZL, BZS. 85: AGS, CLS, URU. Probably only on coastal habitats, often maritime sands. Map 184.

8. *Juncus roemerianus* Scheele, *Linnaea* 22: 348 (1849)

T: [USA, Texas] 'Galveston island auf feuchtem Muschelsand', 4 Apr 1846, *Römer*; holo: B, destroyed.

Illustrations: S. Snogerup, *Willdenowia* 23: 66, fig. 21 (1993); R.E. Brooks & S.E. Clemants, *Fl. N. Amer.* 22: 236 (2000)

Map: S. Snogerup, *Willdenowia* 23: 68, fig. 22 (1993); R.E. Brooks & S.E. Clemants, *Fl. N. Amer.* 22: 238 (2000).

Perennials, (15–) 50–150 (–230) cm long; rhizome creeping, stout, with internodes usually short; intravaginal shoots absent. Cataphylls 2–5, to 10 cm long; blade tiny. Leaves 40–125 cm long, 1.5–4 mm in diam. Lower bract (2–) 5–20 (–90) cm long, including a sheath 1.5–3 (–5) cm long; middle bracts small, amplexicaul, with blade ±absent; bracts subtending heads considerably shorter than flowers. Plant gynodioecious, with female and ±hermaphrodite clones. Inflorescence (2–) 5–20 (–45) × 3–6 (–12) cm, usually lax, ±broad; heads (15–) 30–100 (–200), 2–8 (–25)-flowered. Tepals 2.2–3.5 mm long, subequal, with margins scarious; outer tepals ±narrowly ovate, with base keeled, distally scarious margins slightly broader and mucro up to 0.3 mm long; inner tepals oblong, obtuse, with scarious part broad near apex. Stamens 6, equalling tepals or slightly shorter, rudimentary in pistillate flowers;

JUNCACEAE (*Juncus*)

Perennials, (40–) 50–80 (–100) cm tall, densely caespitose; rhizome short-noded, branching. Intravaginal shoots present. Cataphylls 2–4 (–5), to 10 cm long. Leaves 15–60 cm long, including sheaths up to 10 (–25) cm long, (1.5–) 2–3 mm in diam., striate. Lower bract leaf-like, thin, (2.5–) 6–22 cm long, including a sheath 1.8–4 cm long; middle bracts with large sheath and small lamina; bracts subtending heads usually shorter than flowers. Inflorescence (3–) 4–15 × (1–) 1.5–3 (–5) cm, with 3–20 (–25) heads. Heads (1–) 4–8 (–12)-flowered. Tepals 5–6.5 mm long, subequal, later with thick spongy bases; outer tepals aristate with arista to 1 mm long, with distal margin scarious and to 0.5 mm wide; inner tepals oblong, with broad distal thin fragile scarious wings, ±emarginate. Stamens 6, $\frac{2}{3}$ – $\frac{3}{4}$ as long as tepals; anthers (2.2–) 2.5–3.5 mm long, (2.5–) 5–7 times as long as filaments; style 1.5–2 mm long; stigmas 2.5–3.5 mm long. Capsule 4–5.5 mm long, ±exceeding tepals, trilocular, thick-walled, ovoid, ±trigonous, attenuate, acute to obtuse, straw-brown; mucro inconspicuous; seeds c. 60–70. Seeds 0.9–1.1 mm long, or 1.5–1.9 mm long including appendages, 0.4–0.6 mm broad, ellipsoidal to ovoid, c. 25-striate; appendages short, ±unequal. Fig. 48.

Endemic to California and Nevada, USA. 76: CAL, NEV. Saline and brackish marshes, in desert valleys on soils with high salinity. Map 186.

CALIFORNIA: Salton Lake, Travertine Terraces, *S.B.Parish* 8428 (CAS); Inyo Co., Death Valley, Furnace Ck, *S.Riebe* [cult. *S.Snogerup* 4165, 4166] (LD); Inyo Co., Saline Valley, *M.DeDecker* 2617 (RSA); Harmony Borax Works, *S.Snogerup & B.Snogerup* 3440 (LD). **NEVADA:** Clark Co., Redgypspring, *Gullion* 502 (UC).

Hybrids

Juncus acutus L. × *J. heldreichianus* T.Marsson ex Parl.

Usually a moderate-sized plant. Inflorescence slightly elongate, capsules often light coloured with a long conical tip, appearing unfilled. Seed set irregular, from 0% up to at least 30% in the best developed capsules. Pollen almost 100% staining. Found repeatedly in Greece.

13. GREECE: Naxos, *S.Snogerup* 1676, 1707, 1728 (LD).

Juncus acutus L. × *J. littoralis* C.A.Mey.

Usually a tall plant forming large tussocks. Inflorescence and flowers like those of *J. littoralis*. Capsules differently developed; the large ones with a conical top. Seed set

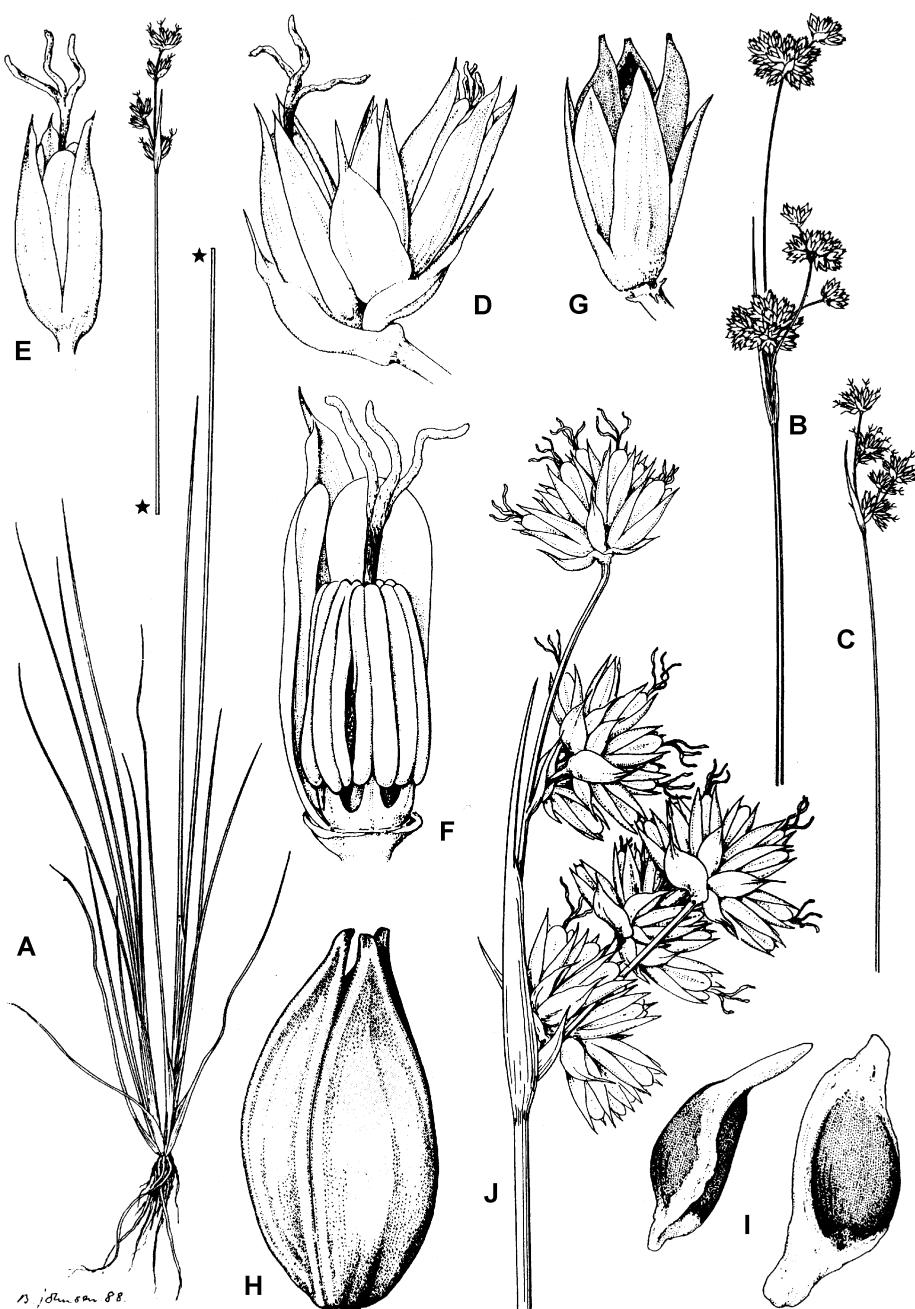

Figure 48. *Juncus cooperi*. **A**, young plant in first flower; **B, C, J**, inflorescences; **D**, head in onset of flowering; **E**, flower; **F**, dissected flower; **G**, flower with opened fruit, apices of inner tepals collapsed; **H**, capsule; **I**, seeds. (**A, C–F, H–J**, S.Riebe, S.Snogerup, cult. nos. 4166, 4165, LD; **G**, S.Snogerup 3440, LD). Scale bars: **A–C** = 10 cm; **D, E, G** = 5 mm; **F** = 3 mm; **H** = 2 mm; **I** = 1 mm; **J** = 2 cm. Drawn by B.Johnsen. Reproduced with permission from S.Snogerup, *Willdenowia* 23: 70, fig. 23 (1993).

JUNCACEAE (*Juncus*)

irregular, from 0% to c. 50% in the best developed capsules. Pollen almost 100% staining.
Found in Italy, Greece and Israel.

34. ISRAEL: Acre Plain, Qishon R., 12 Apr 1925, *Smoly* (HUJ, S, W)

Juncus heldreichianus T.Marsson ex Parl. × *J. littoralis* C.A.Mey.

In habit like moderately tall *J. heldreichianus*. Inflorescence variable, often with long ±erect branches and dense groups of heads. Capsules small and blunt, dark above. Most seeds degenerated, good seeds often few, but in the best capsules at least up to 30%. Pollen 80–95% staining and of normal form. Found in Greece.

13. GREECE: Naxos, *S.Snogerup 1681, 1690, 1691, 1713, 1718* (LD).

Doubtful names:

Juncus variegatus Caruel, *Nuovo Giorn. Bot. Ital.* 2: 276 (1870)

Juncus acutus subsp. *variegatus* (Caruel) Nyman, *Consp. Fl. Eur.* 746 (1882). T: Italy, Toscana, Val-di-Cecina, Monte Cerboli, May 1869, *E.Almansi*.

Probably a synonym of *Juncus acutus* L. subsp. *acutus*.

Juncus maritimus var. *luxurians* Lojac., *Fl. Sicul.* 3: 152 (1909).

T: Sicily, Girgenti, Jul 1874, *Lojacono*; syn: n.v.; Sicily, *A.Todaro*; syn: n.v.

T: *Juncus dregeanus* Kunth

Perennials, caespitose or rhizomatous; stems terete to slightly compressed, with leaf blade flat and not differentiated dorsiventrally, without septa. Flowers in compound to decomound anthesis inflorescences of 1 to many flower heads; individual flowers in the axil of a floral bract; bracteoles absent. Seeds with or without appendages, usually reticulate.

A section of 22 species with centres of diversity in W North America, southern Africa and the Australasian region, extending to South America, Turkey and the Far East. It may not be monophyletic.

- 1 Seeds with two appendages at least 0.2–0.4 mm long
- 2 Anthers c. 0.9–1.5 mm long, slightly longer than filaments; style longer than 1 mm; auricles lacking or subacute, to 0.7 mm long **20. *J. regelii***
- 2: Anthers 1.8–2.6 mm long, usually 2–3 times as long as filaments; style c. 0.6 mm long; auricles at least 1 mm long **21. *J. howellii***
- 1: Seeds without appendages or with a whitish apex to 0.1 mm long
- 3 Stamens 3; if in some flowers stamens 4–6 then triandrous flowers predominating
- 4 Plants dwarf, to c. 5–6 cm tall, mat-forming; leaves to 0.5 mm wide in the middle **18. *J. antarcticus***
- 4: Plants at least medium-sized, at least 10 cm tall, densely to ±loosely caespitose, not mat-forming; leaves wider than c. 0.8 mm
- 5 Inner tepals acuminate to subulate-acuminate, usually 3.8–5.0 mm long
- 6 Style c. 0.2 mm long; stem either creeping and rooting (with leaf rosettes 5–10 cm apart), or floating with leaf rosettes evenly spaced along stem, or ±loosely caespitose with densely branched short rhizome; capsule linear to lanceolate in outline **22. *J. repens***
- 6: Style 0.4–0.5 mm long; plants densely caespitose with a short rhizome, with stem erect; leaves basal and cauline; capsule oblong-ovoid **24. *J. filipendulus***
- 5: Inner tepals obtuse, subobtuse or subacute, sometimes mucronate, 2.4–3.0 (–3.5) mm long
- 7 Auricles present, 0.5–3.0 mm long **25. *J. marginatus***
- 7: Auricles absent
- 8 Longer tepals at least 3.0 mm long; inner tepals usually slightly shorter than the outer ones; capsule ±shorter than perianth; leaves usually 0.8–3.0 mm wide **13. *J. dregeanus***
- 8: Longer tepals up to 2.3 (–2.8) mm long; inner tepals as long as or longer than the outer ones; capsule ±exceeding perianth; leaves usually 2.5–6 mm wide **19. *J. planifolius***
- 3: Stamens 6 or in a minority of flowers only 3–5
- 9 Capsule narrowly prismatic-pyramidal, gradually narrowing, 4.5–5.5 mm long, much exceeding perianth [Turkey] **10. *J. sparganiifolius***
- 9: Capsule ellipsoid to subglobose, retuse, truncate, obtuse or ±abruptly narrowing, up to 4.5 mm long, shorter than or equaling or exceeding perianth (and then apex rounded to retuse) [Not in Turkey]
- 10 Anthers at least 1.5–2 times as long as filaments
- 11 Leaves (5–) 9–13 (–15) mm wide **12. *J. lomatophyllum***
- 11: Leaves up to 5 (–6) mm wide, usually much narrower
- 12 Capsule usually distinctly exceeding perianth
- 13 Seeds c. 0.4 mm long; outer seed-coat tight, distinctly reticulate [Pacific North America] **27. *J. covillei***
- 13: Seeds c. 0.7 mm long; outer seed-coat loose, shining, faintly reticulate [Russian Far East and Japan] **28. *J. prominens***

JUNCACEAE (*Juncus*)

- 12: Capsule usually shorter than or equalling perianth
 - 14 Capsule 2.7–3.1 mm long **15. *J. capensis***
 - 14: Capsule 3.5–4.8 mm long
 - 15 Plants densely caespitose; rhizome short or indistinct; tepals with a smooth central band; auricles distinct, 1.2–2.5 mm long **31. *J. macrophyllus***
 - 15: Plants loosely caespitose; rhizome creeping-ascending; tepals with a scabrid (papillose) central band; auricles absent or short (to 1 mm long) or up to 2 mm long
 - 16 Style 1.3–1.9 mm long; tepals usually with castaneous or translucent-brownish margins **29. *J. orthophyllus***
 - 16: Style 0.5–1.0 mm long; tepals with broad or narrow scarious (less often membranous) margins
 - 17 Auricles 1–2 mm long; tepals pale, greenish or pale brownish; basal leaves not exceeding 1/2 of stem; stem usually longer than 20 cm **30. *J. longistylis***
 - 17: Auricles absent or up to 1 mm long; tepals deep castaneous-brown; basal leaves usually exceeding 2/3 of stem; stem usually 10–20 cm long **26. *J. falcatus***
 - 10: Anthers shorter than filaments or ±equalling them
 - 18 Rhizome ascending-creeping, distally loosely branched and gradually changing in stem; leaves usually ±regularly distributed along stem; all tepals linear-lanceolate, acuminate, with a smooth central band **23. *J. cyperoides***
 - 18: Rhizome short, densely branched, or creeping-ascending but then not gradually changing in stem; leaves entirely or mostly in a basal rosette; tepals lanceolate to ovate-lanceolate, at least some of them not acuminate (i.e., subacute and mucronate or obtuse), central band scabrid (papillose) or almost smooth
 - 19 Longest tepals c. 1.5–1.8 mm long; capsule c. 2 mm long, exceeding perianth **17. *J. meianthus***
 - 19: Longest tepals longer than 1.9 mm; capsule at least 2.4 mm long, shorter than or equalling perianth
 - 20 Capsule 3.5–4.5 mm long; tepals 4.0–5.2 mm long **26. *J. falcatus***
 - 20: Capsule to 3 mm long; tepals 2.4–4.2 mm long
 - 21 Style 0.4–0.8 mm long; tepals 3.7–4.2 mm long **14. *J. sonderianus***
 - 21: Style 0.2–0.4 mm long; tepals 2.4–3.5 mm long
 - 22 Leaves c. 5–8 mm wide in the middle; lower bract distinctly shorter than inflorescence **11. *J. engleri***
 - 22: Leaves 0.8–3.5 mm wide in the middle, lower bract usually ±equalling inflorescence or longer
 - 23 Capsule dark golden brown to red-brown; inner tepals usually slightly longer than outer ones, to 3.0 mm long [Australasian region] **16. *J. caespiticus***
 - 23: Capsule usually blackish brown; outer tepals usually longer than the inner ones, c. 3.0–3.5 mm long [Southern and East Africa] **13. *J. dregeanus***

10. *Juncus sparganiifolius* Boiss. & Kotschy ex Buchenau, *Krit. Verz. Juncac.* 88 (1879)

T: Plantae Syriae borealis ex Amano occidentali supra Arsus, supra Ursusa pagum [Turkey, Hatay, Arsuz], 2 Jun 1862, C.G.T.Kotschy 102; lecto: Z, *fide* S.Snogerup, in P.H.Davis, *Fl. Turkey* 9: 19 (1986); iso: BM, K, L, P, W [One of four isotype specimens from W bears a note in Buchenau's hand: 'An excellent new species' [translated], and should be given preference].

Illustration: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 242, fig. 114 (1906).

Perennials, 30–40 (–50) cm tall, loosely caespitose, robust; rhizome creeping, branched, with internodes 1–3 cm long, c. 3 mm in diam.; sterile shoots/stolons short. Stem erect or ascending, compressed. Cataphylls c. 1–3, to 5–8 cm long, with base brownish-purplish. Cauline leaves 3–6, dense, usually to 10–13 cm long, flat to V-shaped, (2.5–) 4.0–6.0 (–8.0) mm wide; margins smooth; apex acute. Lower bract leaf-like, c. 1–3 cm long, shorter than inflorescence. Inflorescence decompound, sometimes supra-decompound, much branched, anhelate; branches erecto-patent, diffuse, of numerous 2–6-flowered echinate heads c. 3–5 mm wide. Capitulum bracts ovate-acuminate, aristate, to 2 mm long, ±scarious. Tepals ±unequal, linear-lanceolate, acuminate, subaristate, greenish, sometimes suffused reddish, smooth; outer tepals shorter, 2.4–2.8 mm long; inner tepals c. 2.7–3.5 mm long, margins narrow, paler green or purplish. Stamens 6, rarely 3–5; anthers c. 0.8–0.9 mm long; filaments c. 0.3 mm long, flat; style not easy to distinguish from distal part of capsule, to c. 0.5 mm long; stigmas c. 1.0 mm long. Capsule trigonous, unilocular, narrowly prismatic-pyramidal, elongated, to c. 4.5–5.5 mm long, much exceeding perianth, very gradually narrowing into style, pale brown. Seeds 0.6–0.7 mm long, pale brown, faintly reticulate; appendages absent.

Restricted to C and S Turkey. 34: TUR. Wet places, mostly along, or even in streams. Map 187.

34. TURKEY: Gediz, Murat Dagh, 1400 m, P.H.Davis 36712 (E); İçel, Giosna [Gözne], 800 m, W.Siehe 196 (W); Afyon, Sultan Dagh, 1500 m, J.F.N.Bornmüller [It. Anatol. 3] 5614 (W); Adana, 18 km N of Kamışlı, 1400 m, Sorger 7729-7 (W); 7 km W of Fetiye, 5 Jun 1977, H.Woldrinf E12 (L).

11. *Juncus engleri* Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 248 (1906)

T: Ostafrikanisches Waldgebiet, West-Usambara, 1400–1600 m [Tanzania, W Usambara Mtns], A.Engler 1060; syn: B, destroyed; A.Engler 1409; syn: B, destroyed.

Perennials, 25–40 (–60) cm tall, loosely caespitose; rhizome creeping-ascending; stolons absent; stems ascending, rooting, with internodes short; cataphylls absent. Leaves only basal, mid-green, 12–20 (–40) cm long, (3–) 5–8 (–12) mm wide near base, ±flat to channelled; sheaths closed, to 2 cm long, later split, usually tinged reddish, with margins colourless or whitish, c. 0.1 mm wide; auricles absent; leaf apex subulate. Stems terete, ±smooth, leafless. Lower bract subherbaceous, c. 1.0–4.0 cm long, shorter than inflorescence. Inflorescence ±erect, anhelate; main branches usually 5–10, (1–) 2–6 (–8) cm long, ±smooth; secondary branches subdistal; upper bracts blackish-brown, scabrid (papillose), subtending hemispherical (1–) 3–7 (–10)-flowered heads; uppermost bracts c. one per flower, c. 3 mm long, ±triangular, brownish. Tepals ±unequal; outer tepals lanceolate, carinate, acuminate, c. 2.4–2.7 mm long, dark brown, often scabrid on midrib, with margins narrow and indistinct; inner tepals ovate-lanceolate, broader, c. 2.5–2.8 × c. 1.0 mm, obtuse, dark brown, with margins broad, membranous. Stamens 6; anthers 0.5–0.8 mm long; filaments 0.6–0.7 mm long; style c. 0.2 mm long; stigmas ±reddish, patent-contorted, c. 0.6–0.9 mm long, long papillose. Capsule oblong-ovoid, subtrigonous, ±abruptly contracted in an apiculate apex, c. 1.9–2.5 mm long, shorter than to subequaling perianth, shiny, red-brown above. Seeds ±ovoid, paler brown, 0.4–0.5 mm long including a short whitish apex, c. 0.3 mm wide, faintly reticulate to almost smooth; appendages ±absent.

Confined to a very limited area in the Usambara Mtns and the Pare Mtns, Tanzania. 25: TAN. Boggy places, along streams in open mountain forest. Map 188.

25. TANZANIA: Lushoto, Magamba, Mkuzi R., c. 1750 m, P.J.Greenway 9664 (S); Lushoto, between Mkuzi and Kifungilo, R.B.Drummond & Hemsley 2214 (K); Pare, Mtonto, P.J.Greenway 6548 (K).

Closely related to *J. lomatophyllum* of southern Africa but having very short style and stigmas, smaller flowers and, on average, substantially narrower leaves. The third original specimen cited, Usambara, Mlato [Mlalo] Holst 334a (W), is a *Juncus* inflorescence. It may belong to *J. engleri* but tepals are longer than those in the rest of the material. Buchenau himself listed the specimen with a question mark. Another unnumbered gathering from the same locality [Holst s.n. (PR)] represents *Juncus oxyacarpus*.

JUNCACEAE (*Juncus*)

12. *Juncus lomatophyllus* Spreng., Neue Entdeck. Pflanzenk. 2: 108 (1821)

Juncus lomatophyllus var. *typicus* Buchenau, Bot. Jahrb. Syst. 12: 430 (1890), nom. inval. T: 'in promontorio bonae spei' [Cape Peninsula], Bergius; holo: B, destroyed.

Juncus cymosus Lam., Encycl. 3: 267 (1789), nom. rejic. propos. T: Cap de Bonne-Espér., P.Sonnerat; lecto: P-LAM, fide A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, Fl. S. Afr. 4/2: 82 (1985) [the lectotype is the inflorescence].

Juncus capensis var. *latifolius* E.Mey., Syn. Junc. 48 (1822). T: [without locality and collector]; lecto: S, designated here.

Juncus lomatophyllus var. *lutescens* Buchenau, Monogr. Junc. Cap 466 (1875) [Abh. Naturwiss. Ver. Bremen 4: 466 (1875)]. T: Dutoitskloof, 2–3000 Fuss [Cape, Du Toitskloof], J.F.Drège a; syn: W.

Juncus lomatophyllus var. *aristatus* Buchenau, Monogr. Junc. Cap 466 (1875) [Abh. Naturwiss. Ver. Bremen 4: 466 (1875)]. T: Dutoitskloof [Cape, Du Toitskloof], J.F.Drège f; lecto: W, fide A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, Fl. S. Afr. 4/2: 82 (1985).

Juncus lomatophyllus var. *congestus* Adamson, J. Linn. Soc., Bot. 50: 18 (1935). T: Cape, Swartberg Pass, 4 Feb 1930, R.S.Adamson 181; lecto: BOL, fide A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, Fl. S. Afr. 4/2: 82 (1985).

Juncus viridifolius Adamson, J. Linn. Soc., Bot. 50: 20 (1935). T: Cape, Kirstenbosch, Table Mountain, Skeleton Ravine, 11 Oct 1931, R.S.Adamson 247; holo: BOL.

Illustration: F.G.P.Buchenau, Monogr. Junc. Cap pl. 10 (1875).

Maps: H.Weimarck, Svensk Bot. Tidskr. 40: 157, fig. 6 (1946); A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, Fl. S. Afr. 4/2: 82, map 65 (1985).

Perennials, c. (15–) 35–80 cm tall, robust; rhizome creeping, leafy distally, to c. 4 mm in diam.; stolons often present, long, leafy. Leaves in basal rosette, usually bluish green, rarely pale green, c. 10–20 (–32) cm long, (5–) 9–13 (–15) mm wide, ±flat, base often purplish; sheaths closed, later split, short; margins hyaline, 0.1–0.2 mm wide; apex subulate. Stem thick, rigid, ±smooth to papillose. Lower bract herbaceous, c. 1.0–3.5 cm long, much shorter than inflorescence. Inflorescence usually 5–25 cm long, supra-decompound, less often reduced; main branches ±erect to umbelloid; secondary branches subdistal to median, ±erecto-patent, of (1–) 3 to many, c. (6–) 12–15 (–20)-flowered ±hemispherical heads c. 8–11 mm wide; uppermost bracts scarious with distinct midrib, subaristate, c. 3.5–4.0 mm long. Tepals ±unequal; outer tepals lanceolate, carinate, acuminate-subaristate, c. (3.0–) 3.6–4.7 mm long, with central band ±prominent, usually scabrid, brown to dark brown, often with green midrib, rarely entirely pallid; inner tepals ovate-lanceolate, ±acute to obtuse, c. (3.0–) 3.2–4.0 mm long, with central band ±brown, often with green midrib, with margins membranous, broad. Stamens 6; anthers 1.3–1.6 mm long; filaments, 0.4–0.5 mm long; style (including stylar beak) c. 1.5 mm long; stigmas red, c. 2 mm long, exserted. Capsule trilocular, ±ovoid, ±trigonous, subabruptly contracted in a beak (0.2–) 0.4–0.6 mm long, c. 2.4–2.7 mm long, ±shorter than perianth, usually dark castaneous; capsule segments c. 1.4 mm wide. Seeds ±brown, ovoid, c. 0.4–0.6 mm long, 0.3 mm wide; apex whitish apiculate; surface faintly reticulate. Fig. 49.

Widespread from SW Cape to Transvaal (Northern Provinces) in South Africa, also found in Zimbabwe and S Mozambique. Introduced in New Zealand. 26: MOZ, ZIM. 27: CPP, LES, NAT, SWZ, TVL. 51: nzs. Along streams, shores of ponds and reservoirs, permanently wet mountain habitats. Map 189 (secondary distribution not shown).

13. *Juncus dregeanus* Kunth, Enum. Pl. 3: 344 (1841)

Juncus dregeanus var. *genuinus* Buchenau, Monogr. Junc. Cap 463 (1875) [Abh. Naturwiss. Ver. Bremen 4: 463 (1875)], nom. inval. T: 'inter Coloniam [Cape Colony] & Port Natal', J.F.Drège [4387]; holo: B, destroyed.

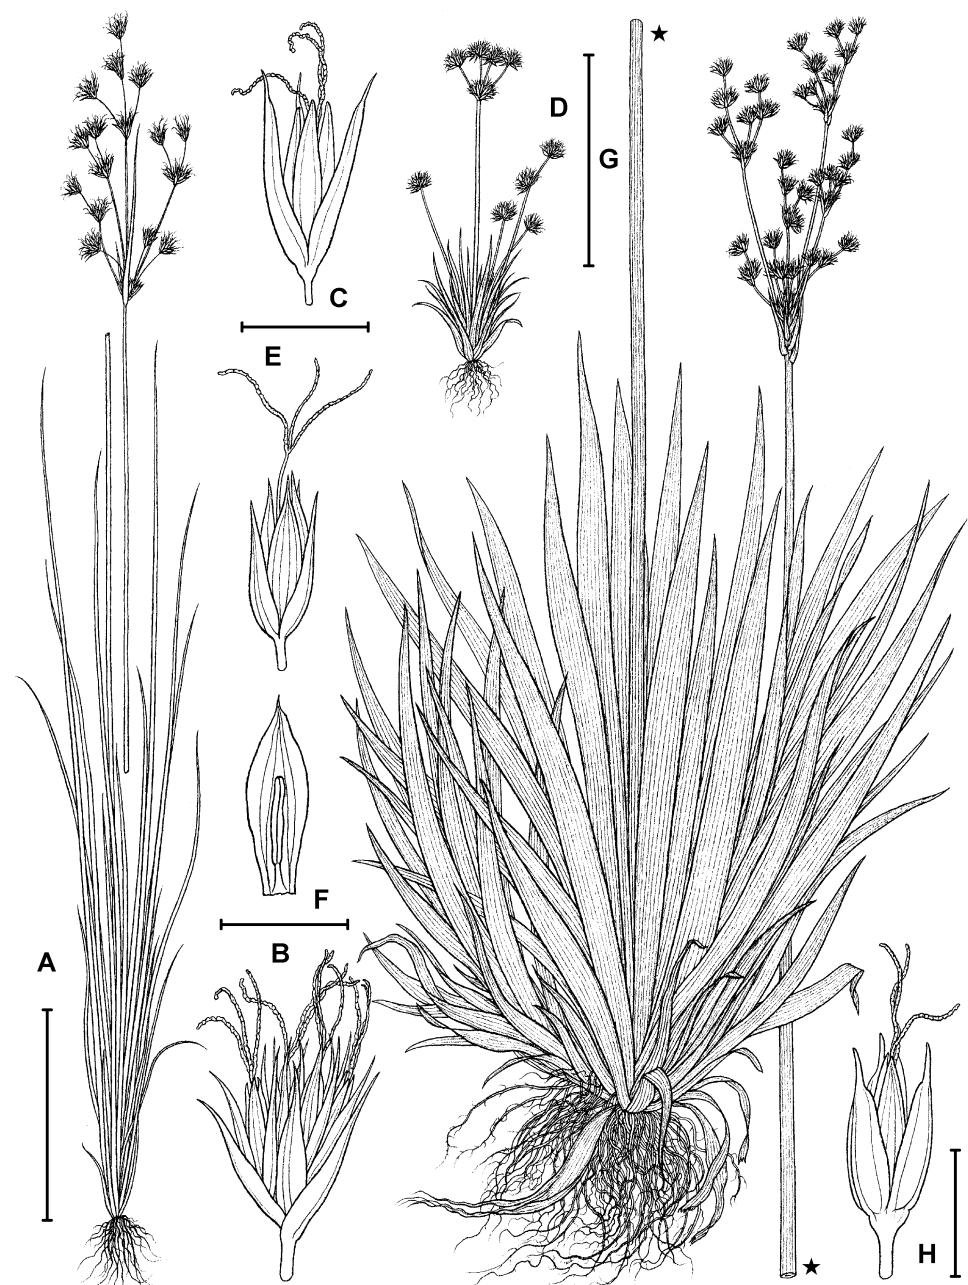

Figure 49. *Juncus capensis*. A, habit; B, flower head; C, flower. *Juncus cephalotes*. D, habit; E, flower; F, inner tepal. *Juncus lomatophyllum*. G, habit; H, flower. (A–C, mainly J.P.H.Acock 3733, K, S; D–F, mainly R.S.Adamson 224, BOL; G, H, mainly according to Hafström, 16 Dec 1934, LD). Scale bars: A, D, G = 5 cm; B–F, H = 3 mm. Drawn by © E.Smrčinová.

JUNCACEAE (*Juncus*)

Maps: H.Weimarck, *Svensk Bot. Tidskr.* 40: 159, fig. 7 (1946); L.Croizat, *Mem. Soc. Brot.* 20: 85, map 135 (1968).

Perennials, c. (10–) 15–25 (–45) cm tall, densely (rarely loosely) caespitose; rhizome usually short, vertical; stolons absent. Leaves basal, (5–) 10–20 (–28) cm long, filiform to narrowly linear, often ±dilated (to 5 mm) and hyaline-bordered at base, otherwise 0.8–1.5 (–3.0) mm wide, slightly canaliculate to subinvolute; sheaths initially closed, later split, with apex acute; auricles absent. Stem leafless, ±smooth. Lower bract narrow, leaf-like, usually 2.5–7 cm long, longer or seldom shorter than inflorescence. Inflorescence usually subcongested, an irregular head of 1–10 subsessile clusters, often with 1–3 (–5) clusters or groups of clusters pedunculate; peduncles short, c. 0.5–3.0 cm long; clusters at first hemispherical, later subglobose, c. 0.7–1.1 cm wide (groups of clusters to 2 cm wide); upper bracts c. 3.5 mm long, subaristate, ±scabrid. Tepals ±unequal; outer tepals lanceolate, acuminate, subaristate, carinate, c. 3.0–3.5 mm long, with central band prominent, sometimes scabrid, rarely pale; inner tepals ovate-lanceolate, subobtuse, c. 2.7–3.0 mm long, with margins broad, membranous. Stamens 3–6; anthers 0.4–0.5 mm long; filaments 0.6–0.8 mm long; style c. 0.2 (–0.3) mm long; stigmas patent, recurved, to c. 1 mm long. Capsule 3-locular, trigonous ovoid to subglobose, ±obtuse to subacute, c. 2.2–2.6 mm long; mucro c. 0.1 mm long; capsule segments c. 1.4–1.6 mm wide, shiny, castaneous-brown to blackish brown, ±shorter than perianth. Seeds ovoid, pale brown, faintly transversely reticulate, c. 0.3–0.5 × 0.25–0.35 mm; apex whitish apiculate.

East Africa from S Sudan and Ethiopia to Cape Province, South Africa, and Cameroon. Edges of streams, swamps, and wet mountain areas in woodlands and grasslands. Two subspecies are recognized.

Stamens 3 or 4–6; seeds (0.25–) 0.30–0.35 (–0.40) mm long; tepals pale
brown to dark brown

13a. subsp. **dregeanus**

Stamens 6, seeds 0.35–0.55 mm long, tepals blackish brown to dark brown

13b. subsp. **bachitii**

Map: A.A.Obermeyer, *in A.A.Obermeyer, J.Lewis & R.B.Faden, Fl. S. Afr. 4/2: 84, map 67 (1985)*.

Capitulum bracts scarious. Tepals pale brown, brown or dark brown. Stamens 3 or 4–6. Seeds c. (0.25–) 0.30–0.35 (–0.40) mm long.

Confined to, and widely distributed in, S and E South Africa from SW Cape to Transvaal. Naturalised in the North Island of New Zealand. 27: CPP, LES, NAT, SWZ, TVL. 51: nnz. A wide range of wet habitats from sea level to the mountains, mostly along streams and in seepage areas. Map 190.

27. CAPE PROVINCES: Amabela, *M. de Vries* 2601 (LD); Uitenhaag, Zwartkopsrivier, *C.F.Ecklon & C.Zeyher* 13 (LD); 799 (S); Port Elizabeth, Winterhoek Mtns, *T.C.E.Fries, T.Norlindh & H.Weimarck* 811, 874, 875 (LD); Fraserburg, Layton, *J.P.H.Acocks* 23534 (K); Stellenbosch, Firgrove, *R.S.Adamson* 129, 137 (BOL). LESOTHO: Sehlabathebe, Tsolikana Valley, *F.K.Hoener* 2152 (K). NATAL: Port Shepstone, *C.J.Ward* 5209 (K, PRE); Clairwood, Durban, *R.E.Fries & T.C.E.Fries* 3137 (LD). TRANSVAAL: Lydenburg, Lisabon State Forest, *C.Reid* 823 (K, PRE).

The type of *J. diaphanus*, the *H.Bolus* 188* specimen, evidently a (major) part of the holotype, annotated by Buchenau before the time of publication of his study (1875), originally in herb. O.W.Sonder, nowadays in S, in all likelihood represents a pallid, hexandrous, ±broad-leaved *Juncus dregeanus*. The plant may well be perennial, although its base is more slender than in the typical form. In its general habit, it also approaches plants described as *J. sonderianus*. Another rather aberrant form was described as *J. mollifolius*. It differs in its flaccid leaves and slender stems and, most notably, in a more loosely caespitose growth; in all the more substantial characters it is identical with *J. dregeanus s. str.*, only the seed size is at the upper limit. It might represent a third subspecies of *J. dregeanus* but further study is needed.

13b. *Juncus dregeanus* subsp. *bachitii* (Steud.) Hedberg, *Symb. Bot. Upsal.* 15(1): 61 (1957)

Juncus bachitii Hochst. ex Steud., *Syn. Pl. Glumac.* 2: 305 (1855). T: 'Abyssin.' [Ethiopia, Tigre Province], Mt Bachit, 11000 ft., *Schimpfer* 114; holo: P, n.v.; iso: PRE, W.

Illustrations: S.Carter, in E.Milne-Redhead & R.M.Polhill *Fl. Trop. E. Africa, Juncaceae* 5, fig. 1 (1966); K.A.Lye, in S.Edwards, Sebsebe D. & I.Hedberg, *Fl. Ethiop. Eritr.* 6: 388, fig. 211.1 (1997).

Capitulum bracts brownish. Tepals blackish brown to dark brown. Stamens 6. Seeds 0.35–0.55 mm long. 2n = c.40, *fide* I.Hedberg & O.Hedberg, *Bot. Not.* 130: 11 (1977). Fig. 50.

In the mountains of the NE, E, and W-C parts of South Tropical Africa. 23: CMN, RWA, ZAI. 24: ETH, SUD. 25: KEN, TAN, UGA. 26: MLW, ZAM, ZIM. In marshes and along streams, mainly in mountain forests, rarely in wet alpine grasslands, usually above 2000 m. Map 191.

23. CAMEROON: Bamenda Highlands, Mt Oku, 2900 m, *I.Fokom* 141 (K). ZAIRE: Karisimbi, 3300 m, *J.-H.Humbert* 8588 (P). RWANDA: Karisimbi, Visoke saddle, Hagenia Zone, *W.D'Arcy* 7563 (CHR, MO, n.v., NSW). 25. KENYA: Mt Elgon, 3800 m, *H.Granvik* 140 (LD); Mt Kenya, 3125 m, *O.Hedberg* 2005 (LD); Aberdare Range, W part of the Nyeri track, 3070 m, *O.Hedberg* 1599 (LD). TANZANIA: Kilimanjaro, 2700 m, *Volkens* 1309 (BM, K). UGANDA: Ruwenzori, Mobuku Valley, 3250 m, *O.Hedberg* 752 (LD); Muavura – Mgahinda saddle, 3050 m, *Purseglove* 2205 (K). 26. ZIMBABWE: Inyanga, Niarerua Ck, c. 1700 m, *T.C.E.Fries, T.Norlindh & H.Weimarck* 2407 (LD); Mare Dam in Nyanga Park, 2000 m, *S.Laegaard* 16038 (LD).

Plants from the southernmost part of the subspecies' range usually have slightly paler perianth; otherwise they correspond to the typical plants from the north.

14. *Juncus sonderianus* Buchenau, *Monogr. Junc. Cap* 476 (1875) [Abh. Naturwiss. Ver. Bremen 4: 476 (1875)]

T: [Cape] Port Elizabeth, *J.F.Drège* e; syn: G, K, LD, P, W ['J.F.Drège e' was generally proposed as a type by Adamson, *J. Linn. Soc., Bot.* 50: 26 (1935)]; [Cape] bei Cap Recief und Port Elizabeth, *C.F.Ecklon & C.Zeyher* 9; syn: BOL, W, S; *C.F.Ecklon & C.Zeyher* 780; syn: n.v.

Map: H.Weimarck, *Svensk Bot. Tidskr.* 40: 160, fig. 8 (1946).

Perennials, 11–35 cm tall, caespitose; rhizome shortly ascending, many-headed; stolons absent. Leaves basal and subbasal (densely inserted to 5 cm up the stem), mid-green to pale green, 5–17 cm long, c. (1.5–) 2–5 (–7) mm wide; margins partly hyaline-bordered; apex acute;

JUNCACEAE (*Juncus*)

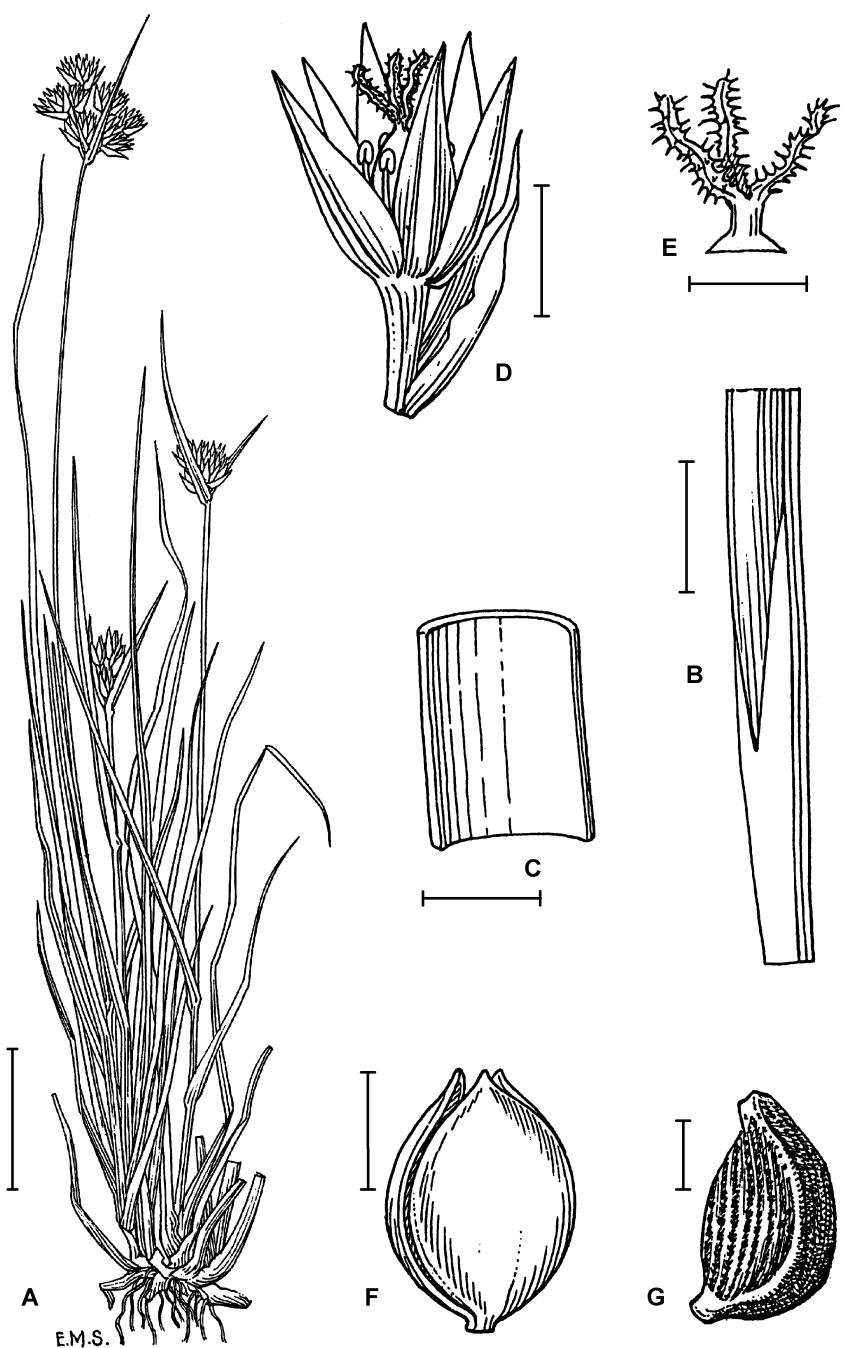

Figure 50. *Juncus dregeanus* subsp. *bachitii*. **A**, habit; **B**, closed sheath; **C**, leaf section; **D**, flower and bract; **E**, style and stigmas; **F**, capsule; **G**, seed. (A, D, E, Fries 1189, K; B, C, F, G, Brenan & P.J.Greenway 8218, K). Scale bars: A = 3 cm; B = 2 cm; C, E, F = 1 mm; D = 2 mm; G = 0.1 mm. Drawn by E.M.Stones. Reproduced by kind permission of the Board of Trustees of the Royal Botanic Gardens Kew, from *Fl. Trop. E Africa*, Juncaceae, p. 5, fig. 1 (1966).

sheaths closed, later split, base green; auricles ±absent. Lower bract leaf-like, c. 1.5–3.5 cm long, usually exceeding inflorescence. Inflorescence usually congested, a globose head of 1–3 (–12) usually 6–12-flowered clusters, or 1–3 clusters shortly pedunculate. Tepals subequal; outer tepals lanceolate, carinate, acuminate-aristate, c. 3.7–4.2 mm long, greenish or pale brown to castaneous-brown, with central band often greenish, ±scabrid; inner tepals ovate-lanceolate, ±obtuse, sometimes shorter than the outer; margins membranous, broad. Stamens 6; anthers 0.5–0.7 mm long; filaments 0.6–0.8 mm long; style 0.4–0.8 mm long; stigmas to c. 1 mm long, suberect. Capsule ±ovoid, trigonous, subacute, apiculate, c. 2.5–3.0 mm long, shorter than perianth, pale greenish brown to castaneous; mucro to c. 0.2 mm long. Seeds ovoid, pale brown, 0.4–0.5 × c. 0.3 mm, faintly reticulate; apex whitish apiculate; appendages absent.

Restricted to S Cape, South Africa, with the most common occurrence in the vicinity of Port Elizabeth. Introduced in New Zealand. 27: CPP. 51: nnz. Wet sandy places, seepage areas, along streams. Map 192 (secondary distribution not shown).

27. CAPE PROVINCE: Riversdale, Droogvlakte, c. 150 m, *J.Muir* 3400 (K); Port Elizabeth, Cape Recife, 24 Dec 1813, *W.J.Burchell* 4386 (BOL, K, W); Port Elizabeth, *T.C.E.Fries*, *T.Norlindh* & *H.Weimarck* 163 (BOL, LD); Port Elizabeth, *T.C.E.Fries*, *T.Norlindh* & *H.Weimarck* 210 (LD); Port Elizabeth, *F.Paterson* 2318 (BOL). 51. NORTH IS.: Whatipu, *E.Cameron* 6336, 17 Dec 1990 (AKU, NSW, PRE).

The relatively high variability, occasional sterility and the intermediate character supports the hypothesis expressed by Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, *Fl. S. Afr.* 4/2: 85 (1985), that *J. sonderianus* may be of hybrid origin, of *J. dregeanus* and *J. lomatophyllum* parentage. The sample *T.C.E.Fries* & al. 210 is closer to *J. lomatophyllum* while *W.J.Burchell* 4386 is similar to typical *J. dregeanus*. The problem requires a field study.

Perennials, c. 12–35 (~80) cm tall, loosely to densely caespitose; rhizome thin, short vertical or elongated ascending; stolons absent. Leaves only basal, variable in length and width, usually 15–25 (~35) cm long, narrow, c. 0.7–2.0 (~3.0) mm wide in the middle, ±dilated at base (to 6 mm wide), flat to canaliculate or involute; sheath initially closed, later split, narrowly hyaline-bordered; auricles usually present, narrow, obtuse, sometimes ±absent (often not visible on older plants); margins smooth; apex subulate. Lower bract narrow, leaf-like, 1.5–5.0 (~12) cm long, usually shorter, rarely longer than inflorescence. Capitulum bracts ovate-lanceolate, acuminate, ±scarious, c. 2.5–3.5 mm long. Inflorescence compound or decompound, anthers, of variable size and shape, of (3–) 5–15 (~50) cup-shaped hemispherical or subglobose 8–15 (~25)-flowered heads usually 7–8 (~11) mm wide. Tepals ±equal or unequal; outer tepals often shorter, rarely ±longer, carinate, lanceolate, acuminate-aristate, (2.8–) 3.5–4.0 (~5.2) mm, with central band straw-brown to brown, bordered deep castaneous, smooth to slightly scabrid, with margins broad and membranous; inner tepals ovate-lanceolate, ±obtuse to subacute, c. 3.0–4.5 (~5.2) mm long, with margins very broad, membranous. Stamens 6; anthers (0.9–) 1.2–1.7 mm long; filaments 0.4–0.6 mm long; style (0.8–) 1.2–1.7 mm long; stigmas (0.6–) 0.8–1.2 (~1.8) mm long, red. Capsule oblong-ovoid, subtrigonous, ±trilocular, c. 2.7–3.1 mm long, acute to subacuminate, top smooth, castaneous-brown to pale brown, usually shorter than perianth; mucro often to 0.5 mm long. Seeds ±ovoid, ±castaneous-brown, c. 0.55–0.60 (~0.75) mm long, faintly reticulate; appendages absent. Fig. 49.

Widespread in SW Cape, distributed in S Cape and reaching S KwaZulu Natal (Transkei). Introduced to St Helena (specimens not seen) and Australia. 27: CPP, NAT. 28: sth [?]. 50: nsw, tas. In a variety of (seasonally) wet habitats, ditches and paths, along streams and near pools, and often also on grassy slopes. Map 193 (secondary distribution not shown).

27. CAPE PROVINCE: Caledon Division, Vogelgat, *I.Williams* 2677 (K, NBG, S); Bottelary Hills, 30 Nov 1934, *J.P.H.Acock* 3733 (K, S); Grabouw near Palmiet R., *H.Bolus* 4220 (BOL); Kirstenbosch, N of Window Stream, *E.Esterhuysen* 23272 (BOL); Worcester, Theewaterskloof, *Thompson* 3838 (NBG); Knysna, Portland, *J.F.Duthie* 966 (LD). **NATAL:** Transkei, Kentani, *A.Pegler* 1107 (BOL). **50. NEW SOUTH WALES:** Centennial Park, xii.1900, *E.Cheel* 7 (BRI, NSW), *L.A.S.Johnson & E.F.Constable* NSW 26267 (K, NSW); Matraville, *O.Evans & E.F.Constable* NSW 52734 (K, NSW); La Perouse, 28 Oct 1975, *R.Coveny* 7293, (A, CANB, CHR, K, L, LE, MO, NSW, RSA).

A very variable species, exhibiting variation in some features ±constant in other taxa (e.g., the length of rhizome). The characters used for discrimination of the numerous taxa believed to be distinct from the typical *J. capensis* (names listed in the above synonymy) mostly concern the richness and shape of inflorescence, size of flowers and general growth. The common intermediates between the ecotypic forms and other morphological extremes show that all the morphotypes belong to a single, variable species.

Perennials, (5–) 10–55 cm tall, densely caespitose; rhizome short; stolons absent. Stem smooth, sometimes flowering in the first year and then plants very slender. Leaves basal, ±flat to canaliculate, narrowly linear, c. 5–8 (–15) cm long, usually 1.0–1.2 (–3.5) mm wide, (to 8 mm wide near base); margins often narrowly hyaline; apex acute to mucronate; auricles absent. Lower bract 2–11 cm long, narrow, subequalling inflorescence or longer than it. Inflorescence anthers or umbelloid, rarely ±congested, of 1–10 (–20) hemispherical to cup-shaped 2–10 (–20)-flowered clusters c. 5–7 mm wide. Capitulum bracts ±ovate-lanceolate, stramineous to castaneous, to c. 2.5 mm long. Tepals ±unequal; outer tepals shorter or equalling inner ones, lanceolate, carinate, acuminate to acute, 1.5–3.0 mm long, pale castaneous-brown with paler ±minutely papillose to smooth midrib; inner tepals subobtuse, ±ovate, c. 2.4–3.0 mm long, broadly membranous-bordered. Stamens 6; anthers 0.4–0.8 mm long; filaments 0.4–0.6 mm long; style 0.2–0.4 mm long; stigmas 0.6–0.8 mm long. Capsule ovoid to ellipsoid, subacute to ±obtuse, subtrigonous, c. 2.5 mm long, trilocular, smooth, dark golden brown to red-brown, shorter than or equalling outer tepals. Seeds broadly ovoid, 0.4–0.6 × c. 0.35 mm, pale brown, faintly reticulate; appendages absent. Fig. 51.

Widely distributed in southern Australia and New Zealand. 50: NSW, SOA, TAS, VIC, WAU. 51: NZN, NZS. In damp, sandy places, often in swampy, brackish ground. Map 194.

50. NEW SOUTH WALES: La Perouse, 16 Mar 1973, *L.A.S.Johnson* 7603, *Jacobs & R.Coveny*, (NSW). **SOUTH AUSTRALIA:** c. 32 km SE of Mt Gambier, Piccaninnie Ponds Natl Park, *Cornwall* 153, (AD, NSW). **TASMANIA:** Tea Tree Ck swamp, c. 2 km E of Buckland, 14 Dec 1968, *Robinson* s.n., (HO, NSW255185); King Island, SE of Dead Sea Lagoon, 4 Mar 1966, *J.Willis* s.n., (MEL, NSW255186). **VICTORIA:** Near Mallacoota aerodrome, *R.Melville* 2762 & *N.A.Wakefield*, 9 Jan 1953 (K, NSW); Coimadai Ck, Bacchus Marsh, Long Forest Flora Reserve, 2 Feb 1991, *Stajsic* 153, (BRI, HO, MEL, NSW). **WESTERN AUSTRALIA:** Ellen Brook, Bullsbrook area, Twin Swamps Wildlife Sanctuary, 28 Dec 1971, *N.T.Burbridge* 7951, (CANB, NSW). **51. Illustrations: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 250, fig. 117 (1906); M.Barros, *Darwiniana* 10: 455, fig. 58 (1953).

Map: H.Balslev, *Brittonia* 32: 52, fig. 1 (1980).

Perennials, (6-) 15–50 (–70) cm tall, densely caespitose; rhizome short; stolons absent; cataphylls absent. Leaves basal; sheaths open, pale brownish, usually suffused reddish; auricles absent; blades to c. 20 (–30) cm long, (1.5–) 2.5–6.0 (–11) mm wide, flat; apex acute. Lower bract leaf-like, to c. 10 cm long, shorter than inflorescence. Inflorescence usually diffuse, rarely subcongested, 2–12 cm long, anethelate, of 3–20 (rarely to 70) hemispherical (3–) 5–12 (–30)-flowered clusters c. 5–7 mm in diam.; peduncles slightly scabrid to smooth. Capitulum bracts lanceolate, acute, castaneous, paler towards margins. Tepals subequal or inner longer, (1.4–) 1.8–2.3 (–2.8) mm long; outer tepals carinate, castaneous to reddish brown, acute, usually with paler and thicker central band; inner tepals ovate-lanceolate, obtuse to ±acute, ±castaneous-brown, often with greenish later brownish central band; margins broad, membranous. Stamens 3 (rarely 4–6); anthers c. 0.4–0.5 mm long; filaments to c. 1.0 mm long; style 0.2–0.3 mm long; stigmas 0.4–0.5 mm long. Capsule ellipsoid to narrowly trigonous-ovoid, c. 2.0–2.5 mm long, golden brown to castaneous-brown, shiny; apex subobtuse, shorter than or ±equalling perianth, subabruptly narrowed into mucro 0.3–0.5 mm long. Seeds ±ovoid, c. 0.35–0.50 × 0.20–0.25 mm, pale brown, distinctly transversely reticulate; appendages absent. Fig. 51.

A species with a wide disjunct distribution. It is native in SW Australia, New Zealand, Chile and Juan Fernández Is., introduced in Hawaiian Is., Ireland and Oregon, USA. 10: ire. 50: NSW, QLD, SOA, TAS, VIC, WAU. 51: NZN, NZS. 63: haw. 73: ore. 85: CLC, CLS, JNF. Open, wet, usually sandy sites, along shores, wet tracks, and seepage sites. Map 197.

Juncus jonesii Rydb., *Fl. Rocky Mts.* 153 (1917). T: Utah, Alta, Wasatch Mountains, 6 Aug 1879, *M.E.Jones* s.n.; holo: NY [at the same time an isoparatype of *Juncus regelii*].

Illustrations: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 240, fig. 113 (1906); C.L.Hitchcock & al., *Vasc. Pl. Pacif. Northw.* 1: 206 (1969).

Map: R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 227 (2000).

Perennials, c. 15–55 cm tall, loosely caespitose; rhizome long, creeping, usually with long internodes; stolons present. Stem slightly compressed, papillose. Cataphylls absent or 1–2, dull brownish, to c. 3 cm long; basal leaves few. Cauline leaves 1–3; lower leaves c. 10–25 cm long; upper leaves with blade 4–7 cm long, c. 1.5–2.5 (–4.0) mm wide; sheaths narrow, with a very narrow membranous margin; auricles ±absent or linear, subacute, to 0.5–0.7 mm long; apex subulate. Lower bract reduced, c. 0.5–2.0 cm long, ±shorter than inflorescence; middle bracts lanceolate, acuminate, to c. 6 mm long, scarious. Inflorescence a single sessile head (rarely up to 3–4 heads), globose, rarely hemispherical, 8–15 (–30)-flowered, with other heads on peduncles to c. 5 cm long. Tepals ±equal, c. 4.5–5.3 (–5.7) mm long, usually abaxially scabrid; outer tepals sometimes slightly longer, lanceolate, acute or subacute, bright castaneous, with central band green or later stramineous; inner tepals ovate-lanceolate, obtuse, broadly bordered, with margins membranous. Stamens 6; anthers 0.9–1.5 mm long; filaments 0.7–1.2 mm long; style c. 1.0–1.4 mm long; stigmas 1.5–2.5 mm long. Capsule ±ovoid, trilocular, trigonous, ±truncate with a short mucro, ±equalling perianth, c. 3.5–4.5 mm long. Seeds narrowly ellipsoid, ±pale brown, c. 0.6–0.7 × c. 0.2 mm long, or 1.4–1.8 mm long including two appendages each 0.5–0.6 mm long, ±smooth; outer seed-coat ±loose. Fig. 52.

Map: R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 227 (2000).

Perennials, 20–30 cm tall, loosely caespitose; rhizome creeping, long; stems slightly compressed, loosely tufted or spaced. Cataphylls 0–2, loose, brownish, to c. 7 cm long; basal leaves 2–4. Cauline leaves 2–3, flat, 12–15 (–30) cm long, 2–4 mm wide; sheaths ±loose; margins membranous; auricles scarious, oblong, obtuse, 1–2 (–3) mm long. Lower bract reduced, to c. 3 cm long, much shorter than inflorescence; margins papillose-serrulate. Inflorescence decompound, anthalate, loose, c. 4–9 cm long, of (2–) 3–9 hemispherical 3–8 (–10)-flowered heads c. 10–15 mm wide. Tepals subequal; outer tepals usually slightly shorter, ovate-lanceolate, 5.2–6.4 mm long, with central band pale green bordered deep castaneous and distally scabrid; apex acuminate, dark; margins membranous to brownish-scarious, broad, subabruptly narrowing (apex obtuse or mucronate), sometimes forming very short auricles. Stamens 6; anthers 1.8–2.6 mm long; filaments 0.5–1.0 mm long; style c. 0.6 mm long. Capsule trilocular, obovoid; apex subobtuse, subabruptly narrowing in a short mucro, c. 3.5–4.8 mm long, shorter than perianth, tan. Seeds ±ellipsoid, 0.5–0.7 × c. 0.25 mm long, conspicuously reticulate, brown; appendages distinct, 0.2–0.4 mm long each. Fig. 53.

Endemic in the mountains of California, Oregon and Washington; an occurrence in Idaho requires confirmation but is possible. 73: ?IDA, ORE, WAS. 76: CAL. Moist meadows and open damp places in the mountains. Map 199.

JUNCACEAE (*Juncus*)

Juncus subincurvus Steud., *Syn. Pl. Glumac.* 2: 303 (1855). T: Louisiana, R.Hartmann 86; holo: P; iso: P.

Illustration: H.A.Gleason, *Ill. Fl. N. U.S.* 1: 393 (1952).

Maps: W.C.Muenscher, *Aquat. Pl. U.S.*, map. 231 (1944); R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 230 (2000).

Perennials, heteromorphic; one form caespitose (in drier places) with one to several stems 5–15 cm tall, each with 1–4 (–8) flower heads; in wet sites and shallow water prostrate with creeping and rooting stems and leaf rosettes developing 5–10 cm apart along the stem; when floating then with remote rosettes. Rhizome sometimes present, densely branched. Stems compressed, 0.8–2.0 mm in diam., up to 50 cm long, internodes 5–10 cm long. Leaves in dense rosettes, 2–15 cm long, 1–4 mm wide, flat; blades not distinctly separated from sheaths 0.5–1.5 cm long; margins scarious; auricles rounded to acutish, to 0.5 (–0.8) mm long. Lower bract leaf-like; floral bracts broadly lanceolate, mucronate, 1–2 mm long. Inflorescence an anthela of 2–8 conical to hemispherical 2–20-flowered heads 7–13 (–20) mm in diam. Tepals unequal, green or slightly reddish; outer tepals 2.8–4.2 mm long, scarious towards margins; inner tepals longer (3.5–) 4.0–5.0 mm long, subulate; margins distinct, narrow, involute, scarious. Stamens 3; anthers 0.3–1.0 mm long, at first as long as filiform filaments, after dehiscence only $\frac{1}{7}$ length; style c. 0.2 mm long; stigmas c. 0.4 mm long. Capsule trilocular, linear to lanceolate in outline, trigonous, truncate to retuse, 2.5–3.5 mm long, 0.7–1.1 mm wide, shorter than inner tepals; base thin-walled and hyaline; apex thicker, stramineous to golden-brown. Seeds oblique, ovoid, apiculate, c. 0.3 × 0.15 mm, finely rugose, castaneous; appendages absent.

Most common in the E USA, disjunctly in Cuba and Tabasco in Mexico. Reported from California but material not seen. 74: OKL. 77: TEX. 78: ALA, ARK, DEL, FLA, GEO, LOU, MRY, MSI, NCA, SCA, TEN, VRG. 79: SMX. 81: CUB. Perennials, 40–100 (–130) cm tall, caespitose; rhizome short, rarely to 5–6 cm, densely branched, 2–4 mm diam.; stolons absent. Stems sometimes bulbous-based, slightly compressed, 0.5–3.0 mm diam., smooth. Cataphylls absent; basal leaves 2–5 per stem; sheaths to 9 cm long; blade 10–30 (–45) cm long, 1–5 mm wide, flat, usually with prominent abaxial midrib and two distinct adaxial veins; caudine leaves similar to basal ones, distally shorter; auricles 0.5–1.0 (–3.0) mm long, rounded. Lower bract leaf-like, as long as or shorter than inflorescence; floral bracts lanceolate, acute, scarious, ±as long as tepals or shorter. Inflorescence compound, anethelate, 4–15 × 2–10 cm; main branches to 10 cm long, to 1 mm diam., of (5–) 10–40 (–200) ±hemispherical (1–) 3–9 (–20)-flowered heads 5–7 mm wide, stramineous to dark brown. Tepals unequal, ±brown with green midstripe; outer tepals lanceolate, obtuse to acute, (1.8–) 2.0–2.8 (–3.2) mm long, with margins scarious; inner tepals longer, lanceolate, 2.4–3.0 (–3.5) mm long, obtuse to acute, with margins scarious, inflexed and forming a little cap when young. Stamens 3, sometimes slightly exserted; anthers 0.3–1.0 (–1.2) mm long, shorter than to rarely ±equalling 1.0–1.5 (–2.5) mm filaments; style c. 0.1 (–0.3) mm long; stigmas 0.5–1.0 mm long. Capsule broadly ellipsoid, ±equalling perianth, apiculate, round in T.S., 2.0–2.5 mm long, 1.8–2.0 mm wide, 3-septate, dehiscing apically, dark brown, glossy. Seeds narrowly and obliquely ellipsoid, apiculate, 0.5–0.6 × 0.15–0.2 mm, reticulate, yellow-brown; appendages absent. $2n = 40$, *fide* N.A.Harriman, in Á.Löve, *Taxon* 28: 406 (1979); $2n = 38$, *fide* S.Snogerup, *Bot. Not.* 116: 150 (1963). Fig. 54.

Disjunctly in E part of North America, from SE Canada to the S USA; in Central America from Mexico to Costa Rica; in Cuba and Bermuda in the Caribbean; in S America Venezuela, widespread from SE Brazil to Paraguay, Uruguay and Argentina. 72: NSC, ONT, QUE. 73: COL, ORE. 74: ILL, IOW, KAN, MIN, MSO, NEB, OKL, SDA, WIS. 75: CNT, INI, MAI, MAS, MIC, NWH, NWJ, NWY, OHI, PEN, RHO, VER, WVA. 76: ARI, CAL. 77: NWM, TEX. 78: ALA, ARK, DEL, FLA, GEO, KTY, LOU, MRY, MSI, NCA, SCA, TEN, VRG, WDC. 79: MXC, MXE, MXG, MXS, MXT. 80: BLZ, COS, GUA, HUA, HON, NIC. 81: BER, CUB. 82: VEN. 84: BZL, BZS. 85: AGE, AGS, AGW, PAR, URU. Moist to wet sandy, peaty, or clayey soils, usually in open areas including bogs, shores, marshes, and ditches. Map 203.

JUNCACEAE (*Juncus*)

- 79.** MEXICO: Chiapas, Tenejapa, *D.E.Breedlove* 14803 (AAU, NY); Veracruz, Jalapa, 1200 m, *C.G.Pringle* 8123 (AAU, BR, F, MEXU, MO, NY, PH, S, UC, US, Z). **80.** GUATEMALA: San Juan Chamelco, 1350 m, *P.C.Standley* 92445 (F, NY). HONDURAS: La Paz, Marcala, Quebrada El Cerrón, *R.Molina & R.Molina* 24247 (DS, F, MO, NY). **81.** CUBA: Mateo Sanchez, *E.L.Ekman* 17931 (NY, S, US). **85.** ARGENTINA NORTHEAST: Misiones, Candelaria, Bonpland, *P.Jørgensen* 526 (BAB); Córdoba, Punilla, Sierra Grande, Cavalango, *L.J.Novara* 59 (CORD); San Luis, El Trapiche, 1150 m, *F.Roig* 1303 (SI). ARGENTINA NORTHWEST: Salta, Orán, Puente internacional, Finca Jacúlica, 400 m, *L.Giusti, P.R.Legname & A.Cuezzo* 12050C (CTES). PARAGUAY: Caaguazu, Arroyo Yhú, *E.M.Zardini & Velasquez* 23726 (AAU, MO).

A variable species. Several taxa have often been recognized within *J. marginatus*, mostly on the basis of rhizome length and the presence of stolons, number of heads per inflorescence and tepal shape. The evaluation of the variation in the whole range of the species shows that it is difficult to accord a higher taxonomic rank to any of the variants.

26. *Juncus falcatus* E.Mey., *Syn. Luzul.* 34 (1823)

T: Mont-Real [Monterey, California], *T.Haenke*; holo: PR; iso: LD.

Map: R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 228 (2000).

Perennials, 8–18 (–29) cm tall; rhizome long, creeping; stoloniform, c. 1.0–1.7 mm thick, with remote scarious-stramineous scales. Stem slightly compressed, ±rigid, minutely papillose distally. Cataphylls 0–2, greenish to brown; basal leaves 2–5, c. 6–13 (–20) cm long; caudine leaves 1–3, shorter, margins papillose at least distally; sheath margins scarious; auricles usually ±absent, less often developed, scarious, to 1 mm long. Lower bract leaf-like or pale brownish, 1–5 cm long, equalling or exceeding inflorescence. Inflorescence usually a single, semiglobose-globose c. 2–8-many-flowered dark castaneous terminal head, or composed of 2 (–4) shortly pedunculate clusters of 2–15 flowers. Tepals ±equal or outer ones slightly longer, ovate-lanceolate, finely papillose; outer tepals with narrow scarious to membranous margins, ±acute, deep to dark castaneous brown to dark brown, with central band green to paler brown; inner tepals ±obtuse to subacute, with broader scarious margins. Stamens 6. Capsule trilocular, ±broadly obovoid, ±truncate to refuse at apex, 3.5–4.5 mm long, shorter than or ±equalling perianth, dark castaneous-brown. Seeds ±obliquely ovoid, apiculate, c. 0.5–0.7 × c. 0.3 mm; outer seed-coat not tight, usually shining, slightly reticulate; appendages absent. 2n = 38, *fide* R.L.Taylor & G.A.Mulligan, *Fl. Queen Charlotte Isl.* 2: 44 (1968).

Widely distributed in W North America, Australia and Tasmania. Reports of the occurrence in Japan probably refer to *J. prominens*. Two subspecies are recognized, with intermediates rarely observed (e.g., *W.S.Cooper* 28-11, 2875).

Anthers much longer than filaments; style c. 0.8–1.0 mm long

26a. subsp. *falcatus*

Anthers ±as long as filaments; style c. 0.5 mm long

26b. subsp. *sitchensis*

Perennials, c. 20–45 cm tall, loosely caespitose; rhizome horizontal, creeping, to c. 2 mm diam., with internodes 0.5–5 cm long; stolons present. Stem erect, slightly compressed, ±papillose. Cataphylls 1–3, brownish, usually 1.5–4 cm long. Basal and sub-basal leaves several, c. 5–25 (–30) cm long, (1–) 3–5 (–6) mm wide, flat; cauline leaves 1–3, shorter and narrower; margins papillose-serrulate; apex subulate; sheaths with narrow scarious or membranous margins; auricles absent or up to 0.5–0.8 mm long, subacute, scarious. Lower bract leaf-like or reduced, brownish, 1–4 cm long, much shorter than inflorescence. Inflorescence usually 3–10 cm long, decomound, of (2–) 3–8 (–12) cup-shaped to hemispherical, (4–) 5–8 (–10)-flowered heads on peduncles usually 2–8.5 cm long. Capitulum bracts pale castaneous, to 6 mm long. Tepals subequal, deep castaneous to ±brown; outer tepals often slightly shorter, lanceolate, acute; inner tepals subobtuse, mucronate, 5–6 mm long, with central band green becoming pale brown, narrow, slightly papillose; margins brownish and narrowly membranous. Stamens 6; anthers 1.6–2.8 mm long; filaments 0.4–0.6 (–0.8) mm long; style (including young mucro) 1.3–1.9 mm long; stigmas to 3.5 mm long. Capsule trilocular, elongated-ovoid, ±truncate, c. 3.5–4.5 mm long including 0.4 mm mucro, pale castaneous, shorter than perianth. Seeds narrowly ovoid, c. 0.5–0.6 × 0.25 mm, apiculate, brown, distinctly reticulate; appendages absent. 2n = 40, fide R.E.Brooks & C.E.Clemants, Fl. N. Amer. 22: 226 (2000). Fig. 56.

JUNCACEAE (*Juncus*)

Juncus menziesii var. *californicus* Hook. & Arn., *Bot. Beechey Voy.* 402 (1840). T: [California], Lay & A.Collie; syn: K, n.v.

Illustration: C.L.Hitchcock & al., *Vasc. Pl. Pacif. NorthW.* 1: 200 (1969).

Map: R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 226 (2000).

Perennials, c. 20–35 (–55) cm tall, loosely caespitose; rhizome long, creeping, to 1.5 mm in diam., with internodes long; stolons ascending. Stem subterete to slightly compressed, usually ±papillose. Cataphylls 1–2, dull brownish, to c. 5 cm long; basal leaves few; cauline leaves 2–3, blades flat, c. 3–14 cm long (upper shorter), 1.5–2.5 mm wide; margins often papillose; apex subulate; sheaths narrow, with broad membranous margins; auricles distinct, 1.0–2.0 mm long, broadly obtuse or truncate. Lower bract reduced, pale brownish-subherbaceous, c. 1–2 cm long, shorter than inflorescence. Inflorescence of (1–) 2–4 (–7) subcongested or variably pedunculate cup-shaped to ±hemispherical (2–) 4–7-flowered heads (if heads congested then compound heads to 15-flowered); peduncles to 5–6 cm long, usually shorter. Upper bracts ovate, acuminate, to 6 mm long, ±scarious. Tepals subequal, ovate-lanceolate, conspicuously broadly membranous-bordered; outer tepals subacute; inner tepals subobtuse and often mucronate, c. 4.5–6.0 mm long, with central band green becoming pale brownish, distinctly narrowly bordered castaneous. Stamens 6; anthers 1.1–1.7 mm long, filaments 0.6–1.0 mm long; style 0.7–0.9 mm long; stigmas 1.5–2.5 mm long. Capsule trilocular, narrowly ovoid-trigonous, ±equalling perianth, c. 3.5–4.8 mm long, castaneous-brown above, obtuse to subtruncate; mucro to 0.3 (–0.5) mm long. Seeds obliquely narrowly ovoid, pale brown, apiculate, c. 0.50–0.65 × c. 0.25 mm, indistinctly reticulate; appendages ±absent or inconspicuous. $2n = 40$, *fide* Á.Löve & D.Löve, *Taxon* 30: 849 (1981). Doubtful taxa

Juncus singularis Steud., *Syn. Pl. Glumac.* 2: 302 (1855).

T: Cape, between Vanstadensberg and Bethelsdorp, 1830, J.F.Drège 1604b p.p. [some gatherings with *Juncus dregeanus*]; holo: P; iso: B [destroyed, but picture deposited at W], G, S, W.

Juncus singularis Steud., treated as the only member of subg. *Singulares* by Buchenau, remains unclear. The absolute match in all floral and fruit characters between the original material of *J. singularis* and *J. capensis* strongly supports the conclusion of A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, *Fl. S. Afr.* 4/2: 83–84 (1985) that *J. singularis* should be included in the widespread and variable *J. capensis*. The exceptional leaf characters (a distichous arrangement of leaves and the round T.S.), however, are unknown in other groups of the sect. *Graminifoliae*. The fact that plants with the latter characters have been collected only once, by J.F.Drège in 1830, in a few specimens, suggests that these plants may be accounted for as a rare mutation of *J. capensis*.

Juncus dregeanus var. *longistylus* Adamson, *J. Linn. Soc., Bot.* 50: 21 (1935).

T: not designated [no specimen quoted in the protologue, S Africa].

R.S.Adamson, in R.S.Adamson & T.M.Salter, *Fl. Cape Pen.* 165 (1950), wrote: 'Recorded once 30 years ago at Kirstenbosch'. According to the description, the plant might represent a form of *J. sonderianus*.

Sect. 3. CAESPITOSI

Juncus sect. *Caespitosi* Cout., *Bol. Soc. Brot.* 8: 90 & 104 (1890)

T: *Juncus capitatus* Weigel; lecto, *fide* J.Kirschner & al., *Folia Geobot. Phytotax.* 34: 385 (1999).

Juncus subg. *Juncinella* [Fourr. ex] V.I.Krecz. & Gontsch., in V.L.Komarov, *Fl. URSS* 3: 514 (1935); *Juncus* sect. *Juncinella* (V.I.Krecz. & Gontsch.) Weim., *Svensk. Bot. Tidskr.* 40: 161 (1946); *Juncus* subsect. *Juncinella* (V.I.Krecz. & Gontsch.) Novikov, *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.*, 95(5): 120 (1990). T: *Juncus capitatus* Weigel

Annuals, dwarf to small, 1–15 (–30) cm tall. Leaves basal, canaliculate or rarely ±flat or ±terete, non-septate, acute; auricles absent, marginal; sclerenchyma absent. Lower bract inconspicuous or leaf-like. Inflorescence terminal, usually of 1–7 subsessile to pedunculate 1–12 (–20)-flowered heads; floral bracteoles absent; peduncles not incrassate. Seeds subglobose to oblong-ellipsoid, minutely apiculate, reticulate to ±smooth; appendages absent.

A section of 16 usually delicate annual species centred in Southern Africa and W North America; only a single species, *J. capitatus*, is not confined to either of the two areas. The evolution towards annuality might have taken place in two (or maybe three) areas independently but the section *Caespitosi* represents a very pragmatic solution (see also B.J.Erter, *Mem. New York Bot. Gard.* 39: 34–39 (1986)).

- 1** Stamens 6
- 2**: Tepals usually shorter than 6 mm, usually at least partly (distally) with darker coloration **42. *J. scabriusculus***
- 3**: Outer tepals longer than the inner but of ±equal shape, narrowly linear-triangular to linear-lanceolate, elongated-acuminate, usually slightly recurved; flower heads globose, of echinate appearance **44. *J. stenopetalus***
- 3:** Outer tepals ±shorter than the inner or subequal, with inner usually broader and more obtuse, ±lanceolate to ovate-lanceolate, not distinctly acuminate nor recurved; flower heads cup-shaped, hemispheric or globose
- 4**: Anthers shorter than filaments; style shorter than 0.2 mm; longer tepals shorter than 3 mm **45. *J. rupestris***
- 4:** Anthers longer than filaments; style longer than 1 mm; longer tepals longer than 3 mm
- 5**: Stem and central band of tepals very densely covered with distinctly elevated papillae; plants glaucous-green to pale green; inflorescence of 1–2 (–3) flower heads **46. *J. pictus***
- 5:** Stem and central band of tepals with ±evenly scattered to subdense lower papillae; plants ±mid-green to deep green; inflorescence of 1–6 (–10) flower heads **47. *J. cephalotes***
- 1:** Stamens 2 or 3
- 6**: Lowermost bract herbaceous, usually longer than inflorescence, 8–12 (–20) mm long; outer tepals conspicuously longer (by 1 mm or more) than the inner **32. *J. capitatus***
- 6:** Lowermost bract membranous to tepaloid, shorter than inflorescence, to 2.5 mm long; outer tepals not longer than the inner or slightly so
- 7**: Anthers longer than filaments; style 0.9–4.0 mm long
- 8**: Seeds smooth to faintly reticulate, with longitudinal and transversal ridges equally faint; capsule ±equalling perianth **34. *J. leiospermus***
- 8:** Seeds ±distinctly ridged, longitudinal ridges clearly more distinct than transversal ones; capsule usually shorter than perianth **33. *J. triformis***
- 7:** Anthers shorter than, or ±equalling filaments; style to 0.5 mm long
- 9**: Capsule usually longer (to 1.5 times) than perianth **41. *J. hemiendytus***
- 9:** Capsule shorter to slightly longer than perianth
- 10**: Seeds 0.5–0.8 mm long **38. *J. capillaris***
- 10:** Seeds 0.3–0.5 mm long
- 11**: Bract single **40. *J. uncialis***
- 11:** Bracts 2–10
- 12**: Inner tepals distinctly longer than the outer [South Africa] **43. *J. obliquus***
- 12**: Inner tepals ±equalling the outer [W North America]
- 13**: Style reduced, less than 0.1 mm long; anthers to 0.3 mm long; flowers single per stem; seeds smooth to faintly reticulate **39. *J. bryoides***
- 13:** Style 0.1–0.5 mm; anthers longer than 0.3 mm; flowers 1–8; seeds distinctly reticulate
- 14**: Capsule (at least the distal part) dark reddish (to blackish) when ripe; flowers almost always trimerous **35. *J. kelloggii***
- 14:** Capsule pale, pale greenish to light reddish or pinkish; flowers dimerous or trimerous

Annuals, (2–) 3–9 (–15) cm tall, caespitose; rhizome absent. Cataphylls few, ±membranous. Leaves basal, usually 3–4 (–6) cm long, linear, ±canaliculate, c. 0.5 mm wide; sheaths with broad membranous margins; apex acute; auricles absent. Lower bracts 1–2, herbaceous, with the longer usually 0.8–1.2 (–4.0) cm long, overtopping inflorescence; middle bracts ±membranous, ±as long as the respective heads. Inflorescence composed of 1–2 (–4) usually 3–7 (–12)-flowered ±hemispherical heads, with one sessile, and the others on subequal peduncles c. 1–1.5 cm long. Flowers cleistogamous, rarely chasmogamous, usually trimerous. Tepals unequal; outer tepals longer, 3.0–4.5 (–6.0) mm long, oblong-ovate, keeled, long-acuminate, with midrib greenish to pale brown and broad membranous margins; inner tepals usually 2.2–3.6 (–4.0) mm long, ±subacute, mucronate, membranous. Stamens 3, $\frac{1}{2}$ – $\frac{2}{3}$ as long as tepals; anthers c. 0.2–0.5 (–0.6) mm long; filaments (0.6–) 0.8–1.3 mm long; style 0.3–0.5 mm (rarely to 1 mm) long; stigmas c. 1 mm long. Capsule broadly ovoid to ±ellipsoid, c. 1.7–2.2 mm long, much shorter than perianth, subobtuse, ±mucronulate, trilocular, ±castaneous-brown. Seeds ±obliquely ovoid, 0.25–0.35 mm long, c. 0.2 mm wide, pale brown, apiculate; appendages absent, transverse reticulation slight, ±rectangular. $2n = 18$, *fide* S.Snogerup, *Bot. Not.* 116: 149 (1963). Fig. 58.

[c. 1280 m], 10 Jun 1866, *H.N.Bolander* 4864 [*G.Engelmann, Herb. Junc. Bor.-Amer. Norm. 30*]; lecto: MO, *fide* F.J.Hermann, *Leafl. W. Bot.* 5: 114 (1948); isolecto: CAS, MICH, NY, US.

Juncus megaspermus F.J.Herm., *Leafl. W. Bot.* 5: 114 (1948). T: California, Fresno Co., Sierra Nevada, King's River, 6200 ft., Jun 1900, *H.M.Hall & H.P.Chandler* 558; holo: US; iso: DS, MICH, MO, PR.

Illustrations: B.J.Ertter, *Mem. New York Bot. Gard.* 39: 42, fig. 11 (1986); R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 230 (2000).

Maps: B.J.Ertter, *Mem. New York Bot. Gard.* 39: 43, fig. 12 (1986); R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 230 (2000).

Annuals, (2–) 5–12 (–17) cm tall, caespitose. Stem erect, leafless; basal leaves to 5 cm long. Flowers (1–) 2–8, usually trimerous, occasionally dimerous; bracts 2–10, ovate to broadly lanceolate, acute, unpigmented or castaneous, 0.7–2.4 mm long. Tepals linear to lanceolate, (1–) 1.9–4.5 mm long, (0.3–) 0.5–1.1 mm wide; inner tepals usually 0.2–0.8 mm longer (rarely subequal or shorter) than the outer, (acute–) acuminate to attenuate, erect to recurved, with central band remaining green or turning pale to dark reddish. Stamens (2–) 3, 1.5–3.1 mm long; anthers often somewhat sagittate-based, (0.6–) 1–2.2 mm long, c. 1.25–3 times filament length; style (0.5–) 0.9–3.2 mm long; stigmas 0.5–2.5 mm long, often reddish. Capsule (globose–) ovoid to ellipsoid or oblong, (1.1–) 1.6–2.5 (–2.9) mm long, 0.5 times tepal length or sometimes subequal or rarely longer, usually pale to dark reddish. Seeds to 6 (–8) per row and c. 35 (–50) per capsule, variable in size and shape even in the same capsule, subglobose to ellipsoid, 0.3–0.8 mm long, usually apiculate and umbonulate, distinctly ridged or lightly ridged (but then seeds at least 0.5 mm long). 2n = c.36, *fide* B.J.Ertter, *Mem. New York Bot. Gard.* 39: 27 (1986). Fig. 59.

Endemic to the Sierra Nevada and foothills, and San Diego Co., California, United States. 76: CAL. On shallow soil and seepage at the edges of granite outcrops, sandy stream beds, 50–2500 m. Map 213.

76. CALIFORNIA: Fresno Co., Lake Edison, Warm Ck, *B.J.Ertter & J.L.Strachan* 3060 (CAS, DAV, FSC, GH, MICH, MO, NY, PH, RM, RSA, TEX, UC, UTC, WTU); Kern Co., Greenhorn Mtns, Wag Fire Road, *C.B.Hardham* 3680A (CAS); San Diego Co., Highland Valley Road SE of Escondito, *B.J.Ertter & J.L.Strachan* 3538 (ASU, CAS, FSC, GH, LA, MEXU, NY, OBI, RSA, SBBG, SD, TEX, US, UTC, WTU); Tuolumne Co., Tuolumne Meadows, *F.J.Smiley* 739 (GH).

A variable species with the extremes sometimes recognized as separate species (*J. megaspermus* is based on high altitude samples). A complete intergradation between the extremes was observed by B.J.Ertter, *Mem. New York Bot. Gard.* 39: 45 (1986).

JUNCACEAE (*Juncus*)

JUNCACEAE (*Juncus*)

34. *Juncus leiospermus* F.J.Herm., Leafl. W. Bot. 5: 113 (1948)

T: California, Tehama Co., 2 mi [3 km] S of Red Bluff, 20 Apr 1916, A.A.Heller 12326; holo: US; iso: CAS, NZ etc.

Map: R.E.Brooks & C.E.Clemants, Fl. N. Amer. 22: 231 (2000).

Annuals, 2–12.5 cm tall. Stem erect, leafless, (0.1–) 0.2–0.7 (–0.8) mm thick; basal leaves to 4 cm long. Flowers 1–7, commonly trimerous; bracts 2–8, round to acutely ovate, unpigmented or castaneous-brown at centre, 0.7–2.4 mm long; pedicels 0.4–2.2 (–2.5) mm long. Tepals narrowly lanceolate to ovate or oblong, (1.5–) 2.2–4.6 mm long, 0.5–1.4 mm wide, subequal or the inner longer, (rounded–) obtuse to acuminate, ±erect, straight, with central band remaining green or turning reddish. Stamens 3 (–5), 1.7–3.7 mm long; anthers 0.9–3.2 mm long, 1–4 times filament length; style (0.9–) 1.4–4.0 mm long; stigmas 1.3–4.0 mm long, white. Capsule globose to ellipsoid or oblong, (1.5–) 2–4.5 mm long, 0.5 mm longer or shorter than tepals, light to dark reddish or maroon, not contrasting strongly with tepals. Seeds to 12 per row and c. 150 per capsule, ovoid, 0.35–0.45 mm long, usually umbonulate, sometimes apiculate as well, smooth or faintly reticulate.

Endemic in California, United States. A rare plant almost confined to Sacramento Valley and adjacent foothills. Edges of temporary pools. Two varieties are recognized.

Flowers (1–) 2–7; bracts usually castaneous-brown at centre **34a. var. *leiospermus***

Flowers usually solitary, rarely 2; bracts usually unpigmented **34b. var. *ahartii***

34a. *Juncus leiospermus* F.J.Herm. var. *leiospermus*

40. *Juncus uncialis* Greene, *Pittonia* 2: 105 (1890)

T: USA, California, Solano Co., Suisun, 5 May 1890, *E.L.Greene* s.n.; lecto: NDG, *fide* B.J.Ertter, *Mem. New York Bot. Gard.* 39: 70 (1986); iso: DS, F, NA, NDG, UC, US [Material from the same date in LD].

Illustration: B.J.Ertter, *Mem. New York Bot. Gard.* 39: 65, fig. 16 (1986).

Maps: B.J.Ertter, *Mem. New York Bot. Gard.* 39: 71, fig. 18 (1986); R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 232 (2000).

Annuals, 0.8–3.2 (–4) cm tall. Stem erect, leafless, (0.1–) 0.2–0.4 (–0.5) mm thick; culms not dilated just below flower; basal leaves to 2.2 cm long. Flowers single, mostly trimerous; bract solitary, broadly truncate, completely enwrapping culm, unpigmented, 0.25–0.9 mm long; pedicels to 0.5 mm long. Tepals ±lanceolate, (1.7–) 2.1–3.8 (–5.3) mm long, 0.6–0.9 mm wide, subequal or inner to 0.3 (–0.7) mm shorter or rarely to 0.3 mm longer than outer, usually ±acute, erect to recurved, sometimes slightly incurved; central band usually remaining green, occasionally turning reddish. Stamens 2–3, 1.2–2 (–3) mm long; anthers 0.3–0.5 (–0.8) mm long, c. $\frac{1}{3}$ filament length; style 0.1–0.3 mm long; stigmas 0.4–1.3 mm long, white. Capsule ovoid to ellipsoid, subequalling the tepals or shorter by up to 0.5 mm,

(1.2–) 1.8–3.2 (–4) mm long, remaining greenish or more commonly turning reddish to deep maroon and then strongly contrasting with tepals. Seeds to 12 per row and c. 140 per capsule, ±ovoid, 0.3–0.4 mm long, sometimes apiculate or umbonulate, smooth or faintly reticulate. $2n = 32$, *fide* B.J.Ertter, *Mem. New York Bot. Gard.* 39: 27 (1986). Fig. 61.

Endemic to W United States; it is centred in California and Oregon, marginally reaching Nevada. 73: ORE. 76: CAL, NEV. Muddy edges of vernal pools, 45–1700 m. Map 221.

73. OREGON: Harney Co., 6.5 km S of Steens Mtn Loop Road, *B.J.Ertter 4430* (BRY, CAS, CIC, CHR, GH, MO, NSW, NY, ORE, RENO, RM, RSA, TEX, UTC, WTU). **76. T: USA, California, Trinity Co., NE side of the Trinity Alps, Big Flat, 21 Jul 1937, *J.T.Howell 13213*; holo: CAS; iso: DS, GH, MICH, NY, RSA, UC, US.

Map: R.E.Brooks & C.E.Clemants, *Fl. N. Amer.* 22: 232 (2000)

Annuals, (0.2–) 0.3–3.6 cm tall. Stem erect, leafless, 0.1–0.5 mm thick; basal leaves to 1.8 cm long. Flowers 1, usually dimerous. Tepals ±lanceolate, (0.8–) 1.9–3 (–3.5) mm long, 0.5–1.2 mm wide, all equal or inner shorter, rounded to acute, usually recurved or erect; central band usually turning reddish. Stamens 2 (–3), (0.7–) 1–1.8 mm long; anthers (0.2–) 0.3–0.7 mm long, $\frac{1}{3}$ filament length to almost equal; style 0.1–0.4 mm long; stigmas 0.3–1 mm long, white. Capsule obovoid to ellipsoid or oblong, (1–) 1.9–3.5 mm long, slightly less than to 1.5 times tepal length, usually turning reddish at maturity, not contrasting strongly with the tepals. Seeds to 12 per row and c. 70 per dimerous capsule, ovoid to oblong, 0.3–0.55 mm long, often apiculate, sometimes umbonulate as well, smooth or faintly reticulate.

Along the Pacific coast of the United States, from southernmost Washington, Oregon, Idaho and Utah to S California. Vernally moist depressions, streambeds and swales, usually on clayey soils. Two varieties are recognized.

Bracts 1–2; stem 0.1–0.3 mm in diam., not dilated below flower; capsule often exceeding perianth

41a. var. *hemiendytus*

Bracts absent; stem 0.2–0.5 mm in diam., dilated below flower; capsule usually not exceeding perianth

Illustration: F.G.P.Buchenau, *Monogr. Junc. Cap.*, pl. 6, fig. 2, 3 (1875).

Maps: H.Weimarck, *Svensk Bot. Tidskr.* 40: 164, fig. 12 (1946); A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, *Fl. S. Afr.* 4/2: 87, map 69 (1985).

Annuals c. 5–25 (–35) cm tall, slender to robust, single-stemmed to caespitose. Leaves only basal, flat to ±folded, c. (4–) 8–14 (–21) cm long, (0.3–) 0.8–1.8 (–2.4) mm wide; base dilated; margins hyaline; apex acute; auricles absent. Lower bracts few, straw-membranous (rarely distally subherbaceous), with midrib distinct, ovate-lanceolate, (3.5–) 4.5–6.0 (–7.0) mm long, shorter than flower clusters. Inflorescence of usually 1–2 (–5) cup-shaped (1–) 2–7 (–10)-flowered pale stramineous clusters, with one sessile, and the others on erect, ±smooth peduncles to 3.5 cm long. Tepals subequal or inner longer, c. (5.5–) 6.0–8.0 mm long; inner tepals ±subobtuse; outer tepals ±acute to ±mucronate; central band thicker, stramineous, scabrid to ±smooth; margins broad, yellowish membranous. Stamens 6, shorter than perianth; anthers c. (0.8–) 1.5–4.1 mm long, longer than 0.5–1.0 (–1.5) mm filaments; style 2.3–2.8 mm long; stigmas 0.8–2.0 mm long. Capsule narrowly oblong-trigonous, trilocular, ±obtuse above, submucronate, c. 3.5–4.5 mm long, ±castaneous-brown, shining, shorter than perianth. Seeds ±oblong-ovoid, apiculate, c. 0.4–0.5 mm long, c. 0.2–0.25 mm wide, pale brown to brown, with distinct transverse reticulation; appendages absent.

Restricted to a small area in southwestern Cape, South Africa. 27: CPP. Open, damp sandy areas at low altitudes. Map 224.

Illustration: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 262, fig. 121 (1906).

Maps: H.Weimarck, *Svensk Bot. Tidskr.* 40: 163, fig. 10 (1946); A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, *Fl. S. Afr.* 4/2: 87, map 69 (1985).

Annuals, usually 5–15 cm tall, delicate, caespitose. Leaves basal, filiform, canaliculate, to c. 3–5 cm long; base with dilated membranous margins, often purplish; apex acute, often seabrid; auricles absent. Stem and peduncles distinctly scabrid (with elevated papillae), to c. 0.3 mm in diam. Inflorescence bract short, membranous or leaf-like, usually 2–6 mm long; middle bracts brownish membranous, c. 1.5–2.0 mm long. Inflorescence terminal, usually of umbellate appearance, composed of 1 basal and (0–) 1–7 (–10) pedunculate heads; heads 1–4-flowered cup-shaped; peduncles usually 1.0–3.5 cm long, some with a single secondary branchlet. Tepals \pm equal or inner longer and outer narrower and acute; inner tepals subobtuse with involute membranous margins, c. 2.2–2.7 mm long, castaneous-brown with a greenish midrib; central band rigid, scabrid. Stamens 6; anthers c. 0.3–0.4 mm long; filaments 0.5–0.6 mm long; style very short, to 0.2 mm long; stigmas 0.4–0.5 mm long, recurved-patent (often contorted and head-like), reddish, with very long papillae. Capsule subglobular to \pm ovoid, trilocular, subobtuse, \pm mucronate, slightly shorter than perianth, c. 1.4–1.8 mm long, \pm castaneous, shining. Seeds subglobular-ovoid, apiculate, c. 0.35 \times 0.25 mm, pale brown to brown, finely reticulate; appendages absent.

Endemic to the Cape, South Africa. 27: CPP. Damp sands, seepage areas, to c. 1300 m. Map 227.

27. CAPE PROVINCE: Clanwilliam district, Biedouw Valley, *C.Reid 1350* (BOL, PRE); Clanwilliam, Cederberg Tafelberg, 1280 m, *E.Esterhuysen 18140* (BOL); S Cederberg, Krom R Kloof, *E.Esterhuysen 34158* (BOL); Calvinia, Lokenburg, Themed Valley, 1100 m, *J.P.H.Acocks 17421* (K); Nieuwoudtville, Papkuilfontein Farm, *D.Snijman 897* (NBG); Simonstown, Redhill, *R.S.Adamson 347* (NBG); Fisch Hoek Valley, *Wolley Dod 3400* (BOL, K); Noordhoek Vlei, *M.R.Levyns 641* (NBG); Fremt Hoek, *F.R.Schlechter 9224* (K, NSW); Stellenbosch, *R.H.Compton 15313* (NBG).

A distinct species showing limited variation. Plants with long stigmas and anthers longer than filaments, described as *J. schlechteri* and sometimes understood as an aberrant *J. rupestris*, are better classified as a part of the wide variation range of *J. cephalotes* Thunb.

46. *Juncus pictus* Steud., *Syn. Pl. Glumac.* 2: 305 (1855)

T: South Africa, Cape, Namaqualand, Kamiesberg, Leliefontein, *J.F.Drège 2472a*; syn: BOL, G, K, L, P, PR, S.

Illustration: F.G.P.Buchenau, *Monogr. Junc. Cap & Abh. Naturwiss. Ver. Bremen* 4: pl. 6 (1875).

Map: H.Weimarck, *Svensk Bot. Tidskr.* 40: 163, fig. 10 (1946).

Annuals, c. 8–16 cm tall, pale caespitose. Leaves basal, to c. 7 cm long, \pm filiform, \pm flat, c. 0.5–1.2 mm wide; base usually pale purplish, with dilated membranous margins; surface finely verruculose to \pm smooth; apex acute. Stem deeply grooved, very densely covered by elevated papillae. Inflorescence terminal, usually of a single sessile hemispheric to turbinete head and 1–2 heads on papillose peduncles to 1.5 cm long; each head usually 2–5 (–8)-

JUNCACEAE (*Juncus*)

flowered. Tepals unequal; outer tepals ovate-lanceolate, c. 2.4–2.9 mm long, ±acute to mucronate; inner tepals longer, ovate, obtuse, c. 3.5–4.7 mm long; margins membranous, often involute; central band distally ±pinkish, often blackish-purple near tip; base whitish pale straw-brown; central part densely covered with elevated papillae. Stamens 6; anthers c. 1.4–1.7 mm long; filaments 0.4–0.6 mm long; style c. 1.5 mm long; stigmas 0.5–1.2 mm long, colourless to reddish, ±exserted. Capsule narrowly oblong-ovoid, subtrigonous, trilocular, c. 2.5 mm long including mucro c. 0.2 mm long, acuminate to acute, shorter than perianth, pale straw-brown. Seeds ovoid, apiculate, c. 0.6 × 0.3 mm, brown, with distinct longitudinal ridges and fine dense transversal reticulation.

Restricted to a small area in Northern Cape, South Africa. 27: CPP. Wet sandy areas, seepage places near rocks, along streams, to c. 1600 m. Map 228.

27. CAPE PROVINCE: the Kamiesberg, Leliefontein, 18 Dec 1936, R.S.Adamson 1488 (BOL).

A taxon closely related to *Juncus cephalotes*. Although recently included in the latter [A.A.Obermeyer, in A.A.Obermeyer, J.Lewis & R.B.Faden, *Fl. S. Afr.* 4/2] its specific status is retained here. It is characterized by an extremely dense, distinctly elevated papillosity of stems and central part of the tepals, and pale colour. Plants with this character combination are confined to Northern Cape; the rich material of *J. cephalotes*, in spite of great variation, does not exhibit the dense papillosity (stems of the latter are only scabrid with papillae lower, irregularly scattered to subdense). There are two gatherings from Northern Cape [Namaqualand, farm Kliphoek, C.Reid 1317 (BOL); Calvinia district, farm Vondelingfontein, C.Reid 1344 (BOL)] that differ from the typical *Juncus pictus* by plant colour and (partly) their general habit. They may represent a variation limit of *Juncus pictus*, a limit otherwise difficult to characterize due to ±scanty material.

Annuals (2–) 8–13 (–30) cm tall, caespitose, scabrid. Leaves basal, c. 1.5–8 cm long, filiform to flat, usually 0.8–2.0 mm wide; base often purplish with margins dilated, membranous; apex acute. Stem ±grooved, scabrid with ±evenly scattered to dense low papillae. Lower bract usually membranous, rarely partially herbaceous, usually to 1 (–4) cm long, shorter than inflorescence; capitulum bracts membranous, to c. 3 mm long. Inflorescence of 1 sessile and (0–) 1–6 (–10) hemispheric to ±globose usually (1–) 3–8 (–15)-flowered heads; peduncles to 3.5 (–4.5) cm long, scabrid. Tepals ±equal to unequal, outer ±lanceolate; inner tepals usually longer, ovate-lanceolate, subacute to mucronate, c. 3.5–4.5 mm long; margins ±membranous; median part pale greenish to straw-brown, scabrid, with most of the area between margins and centre usually blackish purple to dark castaneous-brown. Stamens 6; anthers 1.2–1.7 mm long; filaments 0.4–0.6 mm long; style 1.0–2.3 mm long; stigmas (1.5–) 2.5–4.5 mm long, red, exserted. Capsule oblong-ovoid, subacute to sub acuminate, c. 2.3–2.8 mm long including mucro 0.2–0.4 mm long, shorter than perianth, usually pale brown. Seeds ±ovoid, apiculate, c. 0.3–0.4 × 0.2 mm, pale brown to brown, distinctly reticulate. Fig. 49.

Endemic to SW Cape, South Africa. 27: CPP. Wet sands, flat sandy or clayey shores of temporary pools, seepage areas, usually near sea level. Map 229.

27. CAPE PROVINCE: Cape Town, Table Mtn, *C.F.Ecklon* 901 (K, S); Bredasdorp, Appelskraal, *J.P.Stokoe* 9395 (BOL, NBG); Cape Flats, *R.S.Adamson* 219 (K); Cape Flats, Crawford, *R.S.Adamson* 332 (BOL); Cape Peninsula, Olifantbosch, *G.Lewis* 1762 (NBG); Kenilworth race course, *E.Esterhuysen* 34116 (BOL); Stellenbosch, Gordons Bay, 22 Oct 1948, *Parker* 4366 (BOL); Paarl, *E.Esterhuysen* 6123 (BOL); Maitland Station, *M.R.Levyns* s.n. (BOL); Kommetje, *M.R.Levyns* [as *R.S.Adamson* 227] (BOL).

Extremely variable in size, from juvenile forms with single-flowered heads to tall plants. It also varies in the inner/outer tepal length ratio; in many cases inner tepals elongate with age but sometimes young plants also have unequal tepals. In general, characters previously used to distinguish numerous taxa in the material of *J. cephalotes* are the most variable ones (size, number of flowers and capitula etc.).

Doubtful species

Juncus dinteri Poelln., *Feddes Report. Spec. Nov. Regni Veg.* 48: 173 (1940).

T: Namibia, Garies, *M.K.Dinter* 4254; holo: B, probably destroyed; the plant not located in SAM, herbarium Dinter.

Equated with *J. bufonius* by A.A.Obermeyer, *in A.A.Obermeyer, J.Lewis & R.B.Faden, Fl. S. Afr.* 4/2: 76 (1985), although the type was not seen by her. The description does not exclude *J. bufonius* but the latter was a species surely known to Poellnitz.

Perennials, rhizomatous or densely caespitose; leaf blade flat, canaliculate, subterete to terete, uni-, bi- or pluritubular, imperfectly or perfectly septate. Inflorescence reduced to a single flower or a single terminal head, or anthelate of several to many heads; floral bracteoles absent. Tepals often white or whitish, or dark castaneous-brown. Stamens frequently exserted. Capsule unilocular, rarely ±triseptate, not trilocular. Seeds usually with two distinct appendages.

A section of 59 species in high mountains of N hemisphere and subarctic regions, centred in the Sino-Himalaya. The section is obviously heterogenous, perhaps polyphyletic, but further research is needed to find a more satisfactory subdivision. The sect. *Stygiopsis* occupies a variety of alpine and subalpine habitats, from montane forests to subnival regions up to c. 5500 m.

1 Majority of partial inflorescences completely sterile, composed of ±cylindrical, feather-like fascicles of bract-like structures; flower heads golden or stramineous

2 Fascicles of bracts c. 2.5–5 mm long; bracts 1.2–1.5 mm long; cauline leaf single; rhizomes short and curved

56. *J. fimbriystyloides*

2: Fascicles of bracts c. 5–8 (~10) mm long; bracts 2.7–3 mm long; cauline leaves 1–4; rhizomes very abbreviated

57. *J. ochraceus*

1: Majority of partial inflorescences with well developed flowers (occasionally proliferation may occur or plants do not set seeds); flower heads not of golden colour

3 Flowers in a single terminal head, or head pseudolateral (overtopped by a ±erect bract), or inflorescence with 1–2 lateral branches, each one-flowered

- 4 Flower head pseudolateral, 1–3-flowered, or terminal, 1 (–3)-flowered, sometimes with 1–2 one-flowered branches, and then whole inflorescence 2–4-flowered
- 5 Tepals brown, deep castaneous brown or dark brown
- 6 Capsule much exceeding perianth, retuse, truncate, obtuse to subacute, 4–8 mm long; seed appendages at least 0.4 mm long
- 7 Outer tepals obtuse, 2.5–3.3 mm long; anthers 0.3–0.4 (–0.6) mm long; style 0.3–0.4 (–0.7) mm long **84. *J. biglumis***
- 7: Outer tepals acute to subacute, 5–6 mm long; anthers 0.6–0.9 mm long; style 0.8–1.7 mm long **85. *J. longirostris***
- 6: Capsule equaling perianth, if (slightly) exceeding it, then acuminate, up to 4 (–4.5) mm long; seed appendages absent or minute, less than 0.1 mm long
- 8 Inner tepals distinctly longer than outer (to 3.5 mm long); style c. 0.5 mm long; auricles 0.5–1.2 mm long **78. *J. biglumoides***
- 8: Inner and outer tepals of ±equal length (if inner longer, then longer than 4 mm); style longer than 0.8 mm, or if style c. 0.5 mm long, then auricles minute
- 9 Leaves filiform, non-septate, bitubular; inflorescence 1-flowered
- 10 Anthers longer than filaments; flower shortly pedicellate; lower bract ±equalling flower; style 1.0–1.7 mm long **82. *J. uniflorus***
- 10: Anthers shorter than filaments; flower sessile; lower bract exceeding flower; style 0.5–0.7 mm long **83. *J. bryophilus***
- 9: Leaves subterete, septate, unitubular; flowers usually 2–3, or if flower single, then sessile and tepals longer than 4 mm
- 11 Anthers shorter than filaments **79. *J. duthiei***
- 11: Anthers longer than filaments
- 12 Stigmas pale yellow; anthers twice as long as filaments; flowers often proliferating **80. *J. harae***
- 12: Stigmas reddish; anthers 3–4 times as long as filaments; flowers not proliferating **81. *J. rhotangensis***
- 5: Tepals whitish or stramineous-whitish or stramineous, sometimes pale greenish or suffused purplish
- 13 Stamens not exserted; capsule much exceeding perianth (by 1.5 mm or more) **101. *J. stygius***
- 13: Stamens conspicuously to slightly exserted; capsule ±equalling or slightly exceeding perianth
- 14 Rostrum c. 2 mm long; inflorescence of one sessile flower and 1–2 lateral one-flowered branches, with a secondary branchlet often present **103. *J. luzuliformis***
- 14: Rostrum up to 0.8 mm long; inflorescence of a single terminal flower or 2–3-flowered terminal head, sometimes with a single lateral one-flowered branch present, with secondary branch absent
- 15 Tepals 4.5–6.0 mm long; style 1.5–2.5 mm long; anthers 2.5–3.5 mm long **104. *J. longistamineus***
- 15: Tepals to 3.8 mm long; style to 1.8 mm long; anthers to 1.5 mm long
- 16 Cauline leaves bract-like, with sheaths enclosing bulbils (later proliferating) **66. *J. trichophyllum***
- 16: Cauline leaves not bract-like; sheaths not enclosing bulbils, later not proliferating
- 17 Anthers 0.8–1.3 mm long; inflorescence usually 2–3-flowered; lateral branches absent; capsule 4–6 mm long **105. *J. maximowiczii***

JUNCACEAE (*Juncus*)

- 17: Anthers 0.5–0.8 mm long; inflorescence usually 1-flowered; lateral branches sometimes present; capsule 3.0–4.5 mm long **102. *J. potaninii***
- 4: Flower head terminal, usually (2–) 3–10 (–25)-flowered
- 18 Tepals brown, dark brown or purplish castaneous-brown
- 19 Leaves unitubular, indistinctly septate; stamens long exserted; anthers 1.3–2.6 mm long; style 1.5–2.5 mm long; bracts (4–) 6–8 (–10) mm long **73. *J. przewalskii***
- 19: Leaves bitubular, not septate; stamens ±equalling tepals; anthers 0.5–1.0 mm long; style c. 0.3–0.5 mm long; bracts 3.5–4.5 mm long **68. *J. triglumis***
- 18: Tepals white, yellowish white or whitish-stramineous
- 20 Bract-like leaves on upper part of stem 2–4; their sheaths enclosing bulbils, later proliferating, plantlet-bearing; inflorescence usually (1–) 3-flowered
- 20: Bract-like leaves on upper part of stem 0–1; sheaths not enclosing bulbils, not proliferating; inflorescence usually more than 4-flowered
- 21 Stigma capitate, pin-like, lobes not developed or very short, to 0.2–0.4 mm long
- 22 Lower bract castaneous-membranous, similar to other bracts, not exceeding inflorescence; stem not grooved; bract-like leaf present on upper part of stem **63. *J. cephalostigma***
- 22: Lower bract with a leaf-like tip exceeding inflorescence, stem deeply grooved; upper cauline leaf absent **64. *J. brachystigma***
- 21: Stigma with three distinct spreading or erect lobes at least 0.5 mm long
- 23 Leaves (when dry) with transverse septa visible externally
- 24 Lower bract leaf-like, much exceeding inflorescence; uppermost leaf exceeding inflorescence; plants slender; tepals stramineous
- 24: Lower bract not leaf-like, nor exceeding inflorescence; uppermost leaf not reaching inflorescence; plants robust; tepals white
- 23: Leaves not septate, or septa weak, not visible externally even when leaves dry
- 25 Lower bract with leaf-like or acicular tip overtopping inflorescence
- 26 Leaves X- or Y-shaped in T.S. (plants with one flower head usually rare in populations of plants with two heads) **52. *J. chrysocarpus***
- 26: Leaves terete (sometimes grooved) or V-shaped in T.S.
- 27 Leaves unitubular
- 28 Auricles distinct, to 1.7 mm long; plants loosely caespitose; rhizomes slender, creeping; seed appendages 0.7–1.2 mm long
- 28: Auricles absent; plants densely caespitose; rhizome short; seed appendages 0.1–0.4 mm long **58. *J. allioides***
- 27: Leaves bitubular or pluritubular
- 29 Loosely caespitose; stems borne singly or in loose groups, not in dense clumps
- 30 Leaves pluritubular **49. *J. khasiensis***
- 30: Leaves bitubular
- 31 Auricles membranous; rhizomes stout; upper cauline leaf absent **59. *J. membranaceus***
- 31: Auricles brown; rhizomes filiform; upper cauline leaf present in some plants **69. *J. leucomelas***
- 32: Leaves bitubular; upper cauline leaf absent **62. *J. spectabilis***
- 32: Leaves pluritubular; upper cauline leaf present in some plants **65. *J. kingii***
- 32: Leaves bitubular; upper cauline leaf present in some plants **70. *J. benghalensis***

- 29:** Densely caespitose; stems in dense clumps or groups
- 32** Capitulum bracts whitish to scarious (one-headed inflorescence rarely found in populations of plants with several flower heads) **48. *J. concinnus***
- 32:** Capitulum bracts pale brown to brown
- 33** Capsule (including rostrum) 4.4–4.8 mm long; upper cauline leaf present **76. *J. trachyphyllus***
- 33:** Capsule (including rostrum or mucro) less than 4 mm long; upper cauline leaf absent or present
- 34** Style 0.4–0.8 mm long; anthers 1.1–1.3 mm long **75. *J. gonggae***
- 34:** Style usually longer than 0.8 mm; anthers 1.5–2.5 mm long
- 35** Auricles reddish-brown; style usually 0.8–1.2 mm long; plants to 8 cm tall **71. *J. perpusillus***
- 35:** Auricles scarious; style usually 1.3–1.8 mm long; plants 6–19 cm tall **74. *J. sherei***
- 25:** Bracts all similar, not leaf-like, all ±shorter than inflorescence
- 36** Leaves bitubular to pluritubular
- 37** Bracts scarious to stramineous **77. *J. modicus***
- 37:** Bracts dark brown to pale brown
- 38** Style 2.0–2.5 mm long; stigmas 0.6–0.8 mm long; upper cauline leaf usually 1 **76. *J. trachyphyllus***
- 38:** Style 0.5–0.8 mm long; stigmas 0.8–2.0 mm long; upper cauline leaf absent **67. *J. thomsonii***
- 36:** Leaves unitubular
- 39** Auricles brown, conspicuous; stigmas stout, 0.3–0.6 mm long **61. *J. leucanthus***
- 39:** Auricles scarious, conspicuous or minute; stigmas thin, 0.6–2.0 mm long
- 40** Densely caespitose; rhizomes creeping; leaves glaucous-green **60. *J. glaucoturgidus***
- 40:** Loosely caespitose; rhizome short; leaves ±mid-green
- 41** Basal leaves 1–2; cauline leaves 2–3; auricles 1.2–1.7 mm long; anthers 1.2–2.2 mm long **59. *J. membranaceus***
- 41:** Basal leaves absent; cauline leaf single; auricles minute; anthers 2.5–2.8 mm long **72. *J. concolor***
- 3:** Flower heads two to many, each with more than 3 flowers
- 42** Leaves septate, tubular or pluritubular
- 43** Tepals white, cream, stramineous or green
- 44** Tepals ±green; proliferating flowers mixed with normal ones in flower heads; normal flowers do not set seeds **106. *J. dongchuanensis***
- 44:** Tepals white, cream or stramineous; flowers normally developed; seed set normal
- 45** Heads usually 2–3-flowered [N America, Europe, S Siberia and Russian Far East] **101. *J. stygius***
- 45:** Heads usually 4–12-flowered [Sino-Himalaya]
- 46** Inflorescence usually of 3 or more heads; leaves stout **51. *J. grisebachii***
- 46:** Inflorescence usually of 1–2 heads; leaves filiform **52. *J. chrysocarpus***
- 43:** Tepals brown to deep castaneous-brown

JUNCACEAE (*Juncus*)

- 47** Plants densely caespitose, with short rhizomes; style 3–4 mm long **100. *J. longiflorus***

47: Plants loosely caespitose, usually with creeping rhizomes; style up to 3 mm long

48 Anthers longer than filaments

49 Inflorescence usually of 7–9 flower heads **97. *J. macrantherus***

49: Inflorescence of 1–3 (–4) heads

50 Inflorescence usually of two unequally peduncled heads; tepals 5–9 mm long **99. *J. sikkimensis***

50: Inflorescence of 1–3 congested heads; tepals to 5.5 mm long **94. *J. deosaicus***

48: Anthers shorter than or equalling filaments

51 Cauline leaves (4) 5–8 mm wide (usually flat, sometimes V-shaped) **91. *J. giganteus***

51: Cauline leaves 1–4, rarely to 5 mm wide, usually subterete or V-shaped

52 Auricles elongated, oblong, (1) 2–3 mm long; lower bract base spathe-like, inflated; tepals 6.5–13 mm long **96. *J. sphacelatus***

52: Auricles absent to short, obtuse, to 1 mm long; lower bract base narrow, not inflated; tepals usually 4.5–6.5 mm long

53 Capsule to 5 mm long, shorter than perianth **98. *J. ganeshii***

53: Capsule 6 mm or longer, exceeding perianth

54 Anthers ±equalling filaments **93. *J. elbrusicus***

54: Anthers distinctly shorter than filaments

55 Cauline leaves 2–4, inserted evenly along stem; auricles distinct, broad, to 1 mm long **95. *J. himalensis***

55: Cauline leaves 0–2 (–3), only sub-basal or in lower half of stem, rarely one higher; auricles ±absent **92. *J. castaneus***

42: Leaves not septate, flat and grass-like or 1–4-channelled (V-, Y- or X-shaped in T.S.)

56 Flowers white, yellowish or ±stramineous

57 Leaf blade flat, grass-like

58 At least some leaves 10–15 mm wide; anthers equalling or slightly longer than filaments **55. *J. crassistylus***

58: Leaves up to 5 mm wide; anthers conspicuously shorter than filaments

59 Auricles developed, c. 0.5 mm long, obtuse, stramineous to brownish **50. *J. gracilicaulis***

59: Auricles absent

60 Inflorescence of 6–21 flower heads; tepals whitish, suffused pink, to 3.5 mm long **90. *J. spumosus***

60: Inflorescence of 1–5 flower heads; tepals cream or stramineous-white, not pinkish, 3.5–5.3 mm long

61 Inflorescence apparently lateral; flower heads dense; leaf margin proximally papillose **53. *J. clarkei***

61: Inflorescence appearing terminal; flower heads loose, divariccate; leaf margin smooth

57: Leaf blade canaliculate or deeply 3–4-grooved (V-, Y- or X-shaped in T.S.)

62 Leaves robust, canaliculate above (V-shaped in T.S.); flower heads usually 3 or more; capsule to 4.7 mm long; seeds (including appendages) to 1.2 mm long **48. *J. concinnus***

- 62:** Leaves filiform, deeply 3–4-grooved (Y- or X-shaped in T.S.); flower heads usually 2; capsule 4.9 mm or more; seeds (including appendages) over 1.7 mm long **49. *J. khasiensis***
- 56:** Flowers brown, castaneous brown or light brown
- 63** Plants (40–) 60–100 cm tall; inflorescence of 4–18 flower heads **91. *J. giganteus***
- 63:** Plants 1–30 (–50) cm tall; inflorescence of 1–3 (–5) heads
- 64** Anthers c. twice as long as filaments **87. *J. milashanensis***
- 64:** Anthers shorter than or subequaling filaments
- 65** Flower heads usually 2–3 (–5); anthers 1.5–2.4 mm long; rhizome creeping; plants loosely caespitose **86. *J. amplifolius***
- 65:** Flower head usually single, rarely 2; anthers to 1.3 mm long; rhizome short or ± ascending; plants densely or ± loosely caespitose
- 66** Style short, 0.5–1.0 (–1.5) mm long; stigmas to 2.5 mm long; plants usually 3–8 cm tall **89. *J. minimus***
- 66:** Style 1.5–2.5 mm long; stigmas 3–4 mm long; plants usually 10–15 cm tall **88. *J. nepalicus***

Illustration: H.J.Noltie, *Fl. Bhutan* 3(1): pl. 11 (1994).

Perennials, 11–35 cm tall, caespitose; rhizomes very short, usually not creeping. Cataphylls usually 1–3, pale, chaffy. Cauline leaves up to 3, evenly spaced, 3.5–21 cm long, 0.8–2.5 (–3.2) mm wide; blade pluritubular, canaliculate above, V-shaped in T.S., not septate; tip obtuse; auricles conspicuous, with free parts 0.5–1 mm long, transparent or whitish-membranous. Lower bract leaf-like, equaling longest peduncle or sometimes exceeding inflorescence; capitulum bracts membranous, whitish-pinkish, usually 5–8 mm long. Inflorescence of (1–) 3–9 (–18) unequally peduncled 6–14 (–17)-flowered capitula 0.7–1.3 in diam. Tepals lanceolate, acute, unequal; outer tepals keeled below, 2.1–4 mm long; inner tepals longer, usually 3.5–5.2 mm long, shining, whitish or pale stramineous. Stamens 6; anthers 1–1.5 mm long, usually completely exserted at maturity; filaments 2.8–5.7 mm long; ovary 1.1–2.6 mm long; style 1.1–1.8 mm long; stigmas 0.7–1.1 mm long. Capsule narrowly ovoid-trigonous, 2.6–3.0 (–3.5) mm long, contracted into short beak 0.6–0.9 (–1.5) mm long, whitish. Seeds 0.6–0.7 mm long, or 0.7–1.2 mm long with two ±unequal appendages.

W, C, & E Himalaya, from Himachal Pradesh, Garhwal and Kumaon to Bhutan, Arunachal Pradesh and adjacent regions of SW China (Sichuan, Yunnan, Tibet). 36: CHC, CHT. 40: EHM, NEP, WHM. In a variety of habitats, from open woodlands, damp rocky slopes to road banks and drier subalpine slopes, 1980–4720 m. Map 230.

JUNCACEAE (*Juncus*)

36. CHINA: Sichuan, Tahsiangling, 2600 m, *H. Smith* 10207 (BM, S, UPS); Yunnan, E of Likiang, above Duinao [Duinaoko], 2900–3100 m, *H. Handel-Mazzetti* 3470 (E, S, WU). TIBET: Kongbo, Mira La, Nyang Chu, 3500–3900 m, *F. Ludlow*, *G. Sheriff* & *G. Taylor* 6031 (BM); Tongkyuk, Tsangpo Valley, 2900 m, *F. Kingdon-Ward* 12105 (BM). **40.** EAST HIMALAYA: Bhutan, Upper Mo Chu, Gasa Dzong, 2800 m, *J. Sinclair* & *D.G. Long* 5023 (K). NEPAL: Chomro to Gandrung, 2250 m, *Barclay* & *Syngue* 2411 (K); Marsiandi Valley, 2600 m, *D.G. Lowndes* 1407 (BM). WEST HIMALAYA: Himachal Pradesh, Chamba, Kulel, 1000 m, *G.A. Gammie* 18174 (K); Uttar Pradesh, Mussorie, 2250 m, *R.R. Stewart* 12846 (S); Deoban, Jaunsar, 2700 m, *C.E. Parkinson* 7141 (S).

Very variable, but usually easily recognized by its inflorescence of several to many small white heads. Forms with a single head can be distinguished from small forms of *J. membranaceus* by the non-tubular leaves and lack of slender, elongate rhizomes.

49. *Juncus khasiensis* Buchenau, *Bot. Jahrb. Syst.* 12: 407 (1890)

T: India, Khasia, *J.D. Hooker* & *J.J. Thomson*; syn: BM, K, W; Khasia, Lailankote, 5000 ft., 22 Oct 1886, *C.B. Clarke*; syn: W.

Illustration: *J.D. Hooker*, *Icon. Pl.* 23: tab. 2234 (1892) [holotype specimen].

Perennials, 6–12 (–28) cm tall, slender caespitose; rhizome short; stolons absent. Cataphylls 1 or 2, pale, chaffy. Cauline leaf single, sub-basal; blade filiform with 3 or 4 deep grooves, to 10 cm long, 0.4–0.7 mm wide, Y- or X-shaped in T.S.; pith solid, not septate; auricles very short, 0.1(–0.6) mm long. Lower bract leaf-like, half length to equalling inflorescence. Inflorescence of (1–) 2 (–5) unequally peduncled 3 (–6)-flowered capitula 0.8–1.1 cm in diam.; secondary peduncle stiffly erect so capitula superposed. Tepals narrowly lanceolate, acute, subequal or with outer ones shorter (3.5–4.5 mm long) than inner ones (4–4.9 mm long), pale stramineous. Stamens 6; anthers (1.3)–1.7 mm long, exserted from tepals; filaments 4.0–4.5 mm long; stigmas 1–1.7 mm long. Capsule narrowly ellipsoid, tapered into persistent style, exceeding tepals, total length 4.9–5.7 mm, golden brown. Seeds 0.8–0.9 mm long, or 1.7 (–2.4) mm long including two unequal appendages.

Confined to E Himalaya and adjacent territories: E Nepal, Bhutan, Sikkim, Assam. 40: ASS, EHM, NEP. Wet rocks and cliffs in open woodlands, 2290–3510 m. Map 231.

T: Sikkim, 3200–4500 m, *J.D.Hooker & J.J.Thomson* Juncus 11; syn: K, LD, S, W.

Juncus phaeocarpus A.M.Lu & Z.Y.Zhang, *Acta Phytotax. Sin.* 17: 126 (1979). T: Ne La Mu, Chang Mu, 3550 m, 11 May 1966, *Chang & Ling* 3285; holo: PE.

Illustrations: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 237, fig. 111 (1906); Lu An-min & Zhang Zhi-yun, *Acta Phytotax. Sin.* 17: 126, fig. 2, 1–5 (1979); Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 178, pl. 41 (1997) as *J. phaeocarpus*.

Perennials, with stout creeping rhizomes. Stems stiffly erect, 20–73 cm tall. Basal leaves 1–2 (–4), to 30 cm long. Cauline leaves up to 3 near base and sometimes 1 on upper part; blade to 32 cm long, 0.8–2.2 mm wide, semi- to subcylindrical, ±canaliculate above, unitubular, septate; septa nearly always visible externally; auricles conspicuous, obtuse, with free part c. 3 mm long, pale brown, membranous. Lower bract erect, leaf-like, usually exceeding inflorescence. Inflorescence terminal, branched, of 2–7 (–13) hemispheric 7–12 (–16)-flowered capitula 1.2–1.8 cm diameter; capitula 1–2 subsessile, others on thick stiff peduncles up to 3 (–5) cm long. Tepals lanceolate, acute; outer tepals 4.8–6.5 mm long, usually shorter than inner ones (5.3–6.7 mm long), whitish or pale stramineous. Stamens 6, partly to completely exserted; anthers linear, 2.4–3.5 mm long, cream; filaments 4–6 mm long; ovary ellipsoid, 2.1–3.6 mm long, gradually tapered into style 2.1–3.6 mm long; stigmas stout, twisted, 1.0–1.6 mm long. Capsule broadly ellipsoid-trigonous, sometimes slightly curved, orange-brown, (4.0–) 4.4–6.2 mm long; mucro 0.3–1.8 mm long. Seeds 0.5–0.7 mm long, or 2.0–2.5 mm long including two subequal appendages.

Confined to E Himalayan region, from Nepal to Bhutan and SE Tibet. 36: CHT. 40: EHM, NEP. Alpine grasslands, wet ravines, open subalpine scrub, 2300–4300 m. Map 233.

36. Related to *J. grisebachii* but more slender; leaves filiform, and usually bearing only a single head.

53. *Juncus clarkei* Buchenau, *Bot. Jahrb. Syst.* 6: 210 (1885)

T: Sikkim Himalaya, 11–14000 ft, *J.D.Hooker Juncus* 14 p.p.; syn: W; Tonglo, Darjeeling, 12 Sep 1875, *C.B.Clarke* 27604B; syn: W; Sikkim, Islumbo, 12000 ft, 24 Oct 1875, *C.B.Clarke* 25565; syn: K, S [fragment], W; Yakla, 10–13000 ft, Oct 1869; *C.B.Clarke* 9621, 9854, 9994bis, 10222; syn: BM, K, W; Sikkim, Jongri, 12000 ft, 15 Oct 1869; *C.B.Clarke* 25886, 25959; syn: W; India, Singale-la, 11000 ft, 8 Oct 1870, *C.B.Clarke* 12711; syn: W.

Juncus clarkei Buchenau var. *marginatus* A.Camus, *Notul. Syst. (Paris)* 1(10): 278 (1910). T: Yunnan, Tsang-chan, 3500 m, 20 Aug 1887, *P.J.M.Delavay* 2656; holo: P.

Perennials, 15–33 cm tall, loosely caespitose; rhizomes slender, creeping. Cataphylls 1–2; caulin leaves 2–3 (–4), flat, grass-like, to 23 cm long, (1.8–) 3.0–4.5 (–5.2) mm wide, gradually tapered to acute apex, with upper one usually overtopping inflorescence; margins sometimes narrowly membranous, usually distinctly papillose in proximal part; papillae patent; veins conspicuous beneath; sheaths often reddish, without auricles. Lower bract erect, leaf-like, greatly exceeding inflorescence; middle bracts pale stramineous, equalling capitulum. Inflorescence apparently lateral of 1–4 unequally peduncled (2–) 4–12-flowered hemispheric capitula 0.9–2 cm in diam.; flowers ±erect, shortly pedicelled. Tepals lanceolate; outer tepals acute, 4.1–7.5 mm long with midrib usually greenish; inner tepals broader, usually longer, sometimes blunt, 4.9–7.5 mm long, pale stramineous. Stamens 6; anthers 1.8–2.5 mm long, usually at least partly exserted; filaments (3.4–) 4–6 mm long; ovary narrowly ovoid, inflated, gradually tapered into a 1.5–2 mm long style; ovary including style 6.5–9.5 mm long, stramineous; stigmas 0.3–1.5 mm long. Capsule usually sterile, narrowly ovoid, tapered into persistent style, long-exserted from tepals, total length to 1.2 cm, pale stramineous. Ripe seeds not seen; appendages present.

In the broader E Himalayan region, from E Nepal to upper Burma, SW China (Sichuan, Yunnan, Tibet). 36: CHC, CHT. 40: EHM, NEP. 41: BMA. Rocky slopes, stony pastures, margins of open woodlands, 1830–4000 m. Map 235.

36. CHINA SOUTH-CENTRAL: Yunnan, Mekong/Nu Jiang [Salween] divide, Shidsaru [Schidsaru] Tibet valley, *H.Handel-Mazzetti* 9705 (S, W); Yunnan, Lichiang Range, 3850–4150 m, *G.Forrest* 6380 (BM, E). **TIBET:** Doshing La, 3850 m, *F.Kingdon-Ward* 13970 (BM). **40. EAST HIMALAYA:** Sikkim, Chooabanja, *King's collector s.n.* (K); Darjeeling, below Kalapokri, 7 Oct 1876, *J.S.Gamble s.n.* (K). **NEPAL:** Simbuwa Khola, below Tseram, 3400 m, *S.Crawford & al.* [KEKE] 820 (K); Gopte Ural, 3500 m, *J.F.Dobremez* 1621 (BM); Nepal, Lamjooma, 5500 m, *Lall Dhwoj* 0251A (BM). **41. BURMA:** NE Upper Burma, 3500 m, *G.Forrest* 24877 (K); North Triangle, Tama Bum, 2900 m, *F.Kingdon-Ward* 21441 (BM).

Similar to *J. crassistylus*, but much smaller, more slender. For differences from *J. hydropophilus* see below.

54. *Juncus hydrophilus* Noltie, *Edinburgh J. Bot.* 51: 138 (1994)

T: Sikkim, Prek Chhu Bridge below Bakhim, 2300 m, 27 Jul 1992, [anonymous: ESIK] 771; holo: E; iso: K.

Illustration: H.J.Noltie, *Edinburgh J. Bot.* 51: 140, fig. 2 (1994).

Perennials, 32–40 cm tall, loosely caespitose; stoloniferous; stolons short, slender (under 1 mm diam.), dark brown, covered with remains of old cataphylls. Cataphyll single, 0.7–4 cm long; basal leaves lacking; caudine leaves 3–4, evenly spaced, flat, grass-like, longest 14–17 cm long, 2–3 mm wide; sheaths 2.5–4.0 cm, reddish-brown, lacking auricles. Non-flowering shoots 3-leaved; blades shorter than stems, grass-like, tapering gradually to acute apex; margins extremely narrowly hyaline, smooth; midrib prominent beneath. Lower bract shorter than inflorescence; blade bristle-like; sheathing base narrowly membranous. Inflorescence usually of a single anthela with 3 (–5) heads, appearing terminal; heads loose, 4–9-flowered, c. 1.5 cm in diam.. Tepals unequal; outer tepals 3.5–5.0 × 0.8–1.4 mm, narrowly lanceolate, acute, keeled, cream; inner tepals 4.0–5.3 × 0.9–1.0 mm, similar in shape, cream. Stamens 6; anthers exserted, 1.4–2.5 mm long, pale yellow, narrowly oblong; filaments exceeding tepals; ovary 5.0–6.5 mm long including style, 1.0–1.5 mm wide, stramineous, very narrowly ovoid, gradually tapered into beak-like style to 1.5 mm long; stigmas 0.5–1.0 mm long, ±spreading. Capsule c. 6.0 × 1.8 mm, very narrowly ovoid, stramineous, shining. Ripe seeds unknown; appendages present. Fig. 62.

Endemic to the E Himalaya, extending from E Nepal to C Bhutan. 40: EHM. On wet cliffs with running water in oak-blue pine forest zone, 2300–3510 m. Map 236.

40. EAST HIMALAYA: Dotena, 2730 m, 20 Jul 1991, *H.J.Noltie* 13 (E); Bumthang, above Gortsam, 3510 m, 10 Aug 1991, *H.J.Noltie* 137 (E). **NEPAL:** NW of Saltie, along trail to Pangsing Bhanjyang, 2760 m, 25 Aug 1974, *T. de Haas* 2547 (BM).

Similar and related to *J. clarkei* but more slender, with lower bract and caudine leaves shorter, not exceeding inflorescence; anthers distinctly exserted. Also characterized by earlier flowering time (July to early August).

55. *Juncus crassistylus* A.Camus, *Notul. Syst. (Paris)* 1(10): 278 (1910)

T: China, Yunnan, Tsang-chan, 3500 m, 20 Aug 1887, *P.J.M.Delavay* 2656; holo: P; iso: TI.

Illustration: A.Camus, *Notul. Syst. (Paris)* 1(10): 282, fig. 19 (1910) as *J. crassifolius* [sphalm.].

Perennials, 30–60 cm tall, robust, loosely caespitose; rhizomes long, creeping, covered with brownish scales, stout, 2–3 mm thick; stolons present. Stem erect, terete, 2–5 mm thick. Cataphylls 1–2, purplish-brown; leaves flat, grass-like; basal leaves 1–2, shorter than upper caudine leaves, 3–10 cm long including sheath, 1–1.5 cm wide; sheath 2–5 cm long; caudine leaves 2–4, 10–30 cm long, 1–2 cm wide; leaf margin broad-membranous, often ±serrulate; auricles obliquely ±absent. Lower bract leaf-like, exceeding inflorescence, 10–15 cm long, 3–6 mm wide, flat, grass-green. Inflorescence anthelate, 3–10 cm long, with 2–4 main branches and 1 to several secondary ones, of 3–8 subglobose 5–20-flowered heads 1–2 cm wide, subtended by several bracts, yellowish white; bracts of heads lanceolate to ovate-lanceolate, 3–15 mm long, 1.5–4 mm wide; sheath-like bract on peduncle membranous, lanceolate, 0.5–0.8 cm long. Flowers 6–8 mm long, 2–3 mm wide; pedicels 1.5–6.0 mm long. Tepals lanceolate; inner tepals 3.5–5.0 mm long, 0.8–2.5 mm wide; outer tepals 3.0–4.0 mm long, 0.8–2.4 mm wide, yellowish white. Stamens 6, ±not exserted, 2.6–3.3 mm long; anthers slightly longer than filaments, linear-elliptic, 1.4–1.8 mm long; filaments 1.2–1.5 mm long; style 1.3–1.5 mm long; stigmas 0.5–0.7 mm long; ovary ovoid-trigonous, 1.6–1.9 mm long, 0.8–1.0 mm wide. Capsule unilocular, oblong-ovoid, subtrigonous, acute, subabruptly contracted in a short mucro, 4.2–6.5 (–8) mm long, pale castaneous-brown, usually exceeding perianth. Seeds ovoid, 0.6–0.8 × 0.3–0.4 mm, 2.4–3.0 mm long including two appendages c. 0.8–1.1 mm long; outer seed-coat very loose.

Confined to Yunnan, SW China. 36: CHC. Banks of streams, grasslands, thickets and slopes in *Abies* forests, above 2000 m. Map 237.

36. CHINA: Yunnan, Dali Shi, Diancang Shan, Zhonghe Temple – Ximatang, 3200 m, *S.K.Wu & al.* 103138 (KUN, TI); Yunnan, Lushui Xian, Pianma – Pianma Pass – Lushui, 3200 m, *S.K.Wu & al.* 103173 (KUN, TI);

JUNCACEAE (*Juncus*)

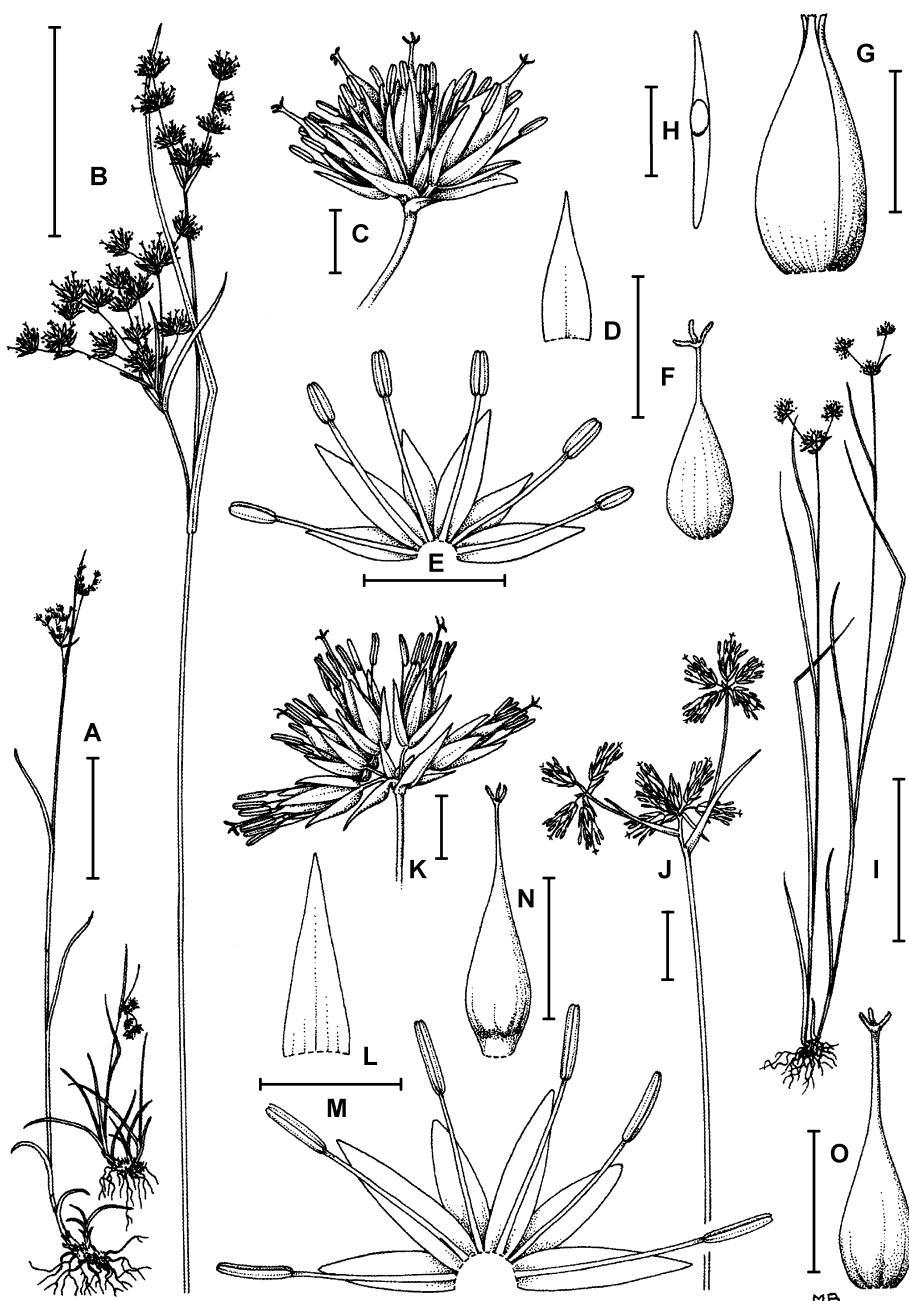

Figure 62. *Juncus spumosus*. **A**, habit; **B**, inflorescence; **C**, partial inflorescence; **D**, bract; **E**, flower; **F**, ovary; **G**, fruit; **H**, immature seed. *Juncus hydrophilus*. **I**, habit; **J**, inflorescence; **K**, partial inflorescence; **L**, bract; **M**, flower; **N**, ovary; **O**, fruit. Drawn by M.Bates. Reproduced by kind permission of the Trustees of the Royal Botanic Garden Edinburgh, from Noltie, *Edinburgh J. Bot.* 51: 140, fig. 2 (1998).

Dali, Tsang Shan, Longquan Peak, 3460 m, 15 Oct 1990, [anonymous: CLD-90] 1343 (K); Shweli Salwin divide, G.Forrest 9026 (K, S); W Yunnan, Yü Hsien, Kung Hsien, McLaren's collectors L90A (K); Yunnan, H.T.Tsai 58016 (K); Yunnan, Tali Range, 2250 m, G.Forrest 28009 (S).

Recently, a new species of the group of *J. crassistylus* and *J. amplifolius* was discovered in the Xiaojin region, Sichuan, China. F.Miyamoto and H.Ohba call it *Juncus hamulus* (the description submitted to *J. Jap. Bot.*); it is characterized by brown tepals with a hook-like appendage near the tip, long stigmas, long-creeping rhizomes, and leaves 1.5–7 mm wide.

56. *Juncus fimbriystyloides* Noltie, Edinburgh J. Bot. 55: 39 (1998)

T: China, Yunnan, Lijiang Prefecture, Yulong Shan, N of Camellia Temple, 3040 m, 11 Oct 1990; [anonymous: CLDJ 1122; holo: E; iso: GH, PE, TI].

Illustration: H.J.Noltie, *Edinburgh J. Bot.* 55: 40, fig. 1B, 42, fig. 2E–J (1998).

Perennials, 9.5–15 cm tall, caespitose; rhizomes short, curved. Cataphylls shining, to 3.5–5 cm long, striate, dull, brown, dark brown at base; apex truncate, mucronate. Vegetative shoots bearing a single erect leaf, usually to 15 cm long. Cauline leaf single; sheath short; auricles truncate, very short (c. 0.2 mm); blade exceeding inflorescence, c. 0.9 mm wide, canaliculate, bitubular, weakly septate, with septa not visible externally. Lower bract with filiform blade shorter than inflorescence. Inflorescence 4–8 cm long, anhelate, branched to 4 orders; branches slender, ascending; flowers replaced by 3.5–6 mm long cylindrical heads of spirally inserted bracts, with each bract subtending a plantlet; bracts 1.2–1.4 mm long, narrowly ovate, acute, keeled, chaffy, stramineous; plantlets composed of several scales with dark brown bases; upper scales bearing small green filiform blades. Fertile flower (only one developed in the material) with unequal tepals; outer tepals 4 × 1.4 mm, lanceolate, acute, concave, stramineous, with margins whitish-hyaline and midrib 3-veined; inner tepals 5 × 1.5 mm. Stamens 6; filaments c. 3.4 mm long; anthers not seen. Capsule 3.5 × 1.8 mm, narrowly ellipsoid, gradually tapered into beak c. 0.7 mm long, stramineous shining. Fig. 63, 64.

Only known from Yunnan, China. 36: CHC. The only population grows in damp slopes in an open oak/pine woodland. The species is known from the type collection only. Map 238.

Related to *J. ochraceus* but caulin leaf single, inflorescence 'heads' smaller, with fewer, smaller and acute (not acuminate) bract-like structures.

57. *Juncus ochraceus* Buchenau, Abh. Naturwiss. Vereine Bremen 3: 292 (1873)

T: Sikkim, 3800 m, J.D.Hooker Juncus 9; holo: K; iso: S, UPS.

Juncus tratangensis Satake, in H.Hara, Fl. E. Himalaya 2: 164 (1971). T: Bhutan, Tongsa to Uto La Road, 2000–2500 m, 17 Apr 1967, H.Kanai & T.Yamazaki 5952; holo: TI.

Illustrations: H.J.Noltie, Fl. Bhutan 3(1): 241, fig. 24 (1994); Wu Kuofang, Fl. R. P. Sinicae 13(3): 230, pl. 56 (1997).

Perennials, 8–28 cm tall, caespitose; rhizomes short. Cataphylls short, pale brown; leaves mostly basal and sub-basal, filiform, usually to 20–23 cm long, grooved, canaliculate, bitubular, septate; septa not visible externally; auricles obtuse, membranous, pale brown, c. 0.3 mm long. Lower bract filiform, usually to 2–3 cm long, shorter than inflorescence. Inflorescence branched, dense, to 12 cm long, with majority of partial inflorescences non-fertile and composed of pedicellate feather-like fascicles of narrowly lanceolate aristate, golden-brown sterile bracts. Fertile flowers usually inconspicuous, situated at base of partial inflorescences, occasionally predominating. Tepals lanceolate, acute or mucronate, equal, 3.3–4.2 mm long, stramineous. Stamens 6, shorter than tepals; filaments 1.2–1.5 mm long; anthers 1.3–2 mm long, often twisted; ovary widely ellipsoid, 1.4–2.7 mm long, abruptly contracted into style 1.8–2 mm long; stigmas erect, twisted, 1.4–2.7 mm long. Capsule widely ovoid-trigonous, c. 2.4 × 1.5 mm, abruptly contracted; mucro c. 1.8 mm. Seeds not developed even in almost ripe capsules.

Restricted to the E Himalaya from C Nepal and Bhutan to Darjeeling and adjacent regions of China. 36: CHC, CHT. 40: IND, EHM, NEP. Moist open ground and shingle along streams and roadbanks, 1220–3660 m. Map 239.

Juncus tratangensis represents a form with perfect flowers, occasionally occurring in the populations of *J. ochraceus*. Not even the developed flowers, however, yield any seed, and the reproduction of the species seems to be exclusively vegetative. Both the morphology of the bract-like structures and the nature of reproduction require further study.

Perennials, usually (8–) 12–30 (–42) cm tall, loosely caespitose; rhizome slender, ±creeping. Cataphylls 0–1, pale brownish-membranous to purplish; basal leaves 1–2 (–4), usually to 10 cm long (sterile shoots with longer leaves, to 25 cm). Cauline leaves 2–3, length variable, with upper ones usually to 6–10 cm including sheath, ±canaliculate at base, unitubular, remotely septate; septa ±not visible externally; tip ±acute to subobtuse; auricles 1.2–1.7 mm long, obtuse. Lower bract entirely scarious or base herbaceous, stramineous to suffused pale brownish, ovate-acuminate, c. 1.0–1.5 cm long, equalling, or sometimes exceeding inflorescence; other bracts scarious-stramineous, ±ovate-lanceolate, with distinct veins, ±equalling inflorescence. Inflorescence a single (5–) 8–15 (–25)-flowered head usually 1.0–1.8 cm in diam.; pedicels c. 1–2 mm long. Tepals ±equal, 4.0–5.3 mm long, ±whitish to pale stramineous, obtuse to acute. Stamens 6, ±exserted; anthers 1.2–2.0 (–2.2) mm long; filaments 3–5 mm long; style 0.7–1.7 mm long; stigmas 1.5–2.0 mm long. Capsule oblong-ovoid to ellipsoid, acuminate, mucronate, 5.5–6.5 mm long including c. 0.5–1.5 mm mucro, brown to castaneous-brown, shining. Seeds c. 0.6 × 0.2–0.3 mm, or 2.5–3.0 mm including seed-coat; appendages subequal, 0.7–1.0 and 0.8–1.2 mm long. n = 60, P.N.Mehra & S.K.Sachdeva, *Cytologia* 41: 31–53 (1976), n.v.

From E Afghanistan to Himalayan parts of Himachal Pradesh and Uttar Pradesh, India, and SW Tibet. 32: TAD. 34: AFG. 36: CHT. 40: PAK, WHM. Reported from Nepal, Sikkim and Yunnan but material not seen. Damp rocky habitats, alpine valleys above 2700 m. Map 241.

34. AFGHANISTAN: Konar, Barg-i-Matal, 2160 m, *T.F.Hewer 1406* (K); Nuristan, Rangul Valley, 2600 m, *W.Thesiger 1432* (BM). **36. TIBET:** Kullu, *Jäschke* (WU). **40. PAKISTAN:** Swat State, Swat R., Kalam, *R.J.Rodin 5614* (K); Chitral, Laspur (Harchin), *Bowes Lyon 30* (BM). **WEST HIMALAYA:** Garhwal, Jelandu Ko Gad, *J.F.Duthie 151* (K); Baltistan, Shagarhang Valley, *J.F.Duthie 12110* (WU); Kashmir, Musjid Valley, 4200–4400 m, *J.F.Duthie 13281* (WU); Himachal Pradesh, Lahul, Udaipur, 2850 m, *R.McBeath 2267* (E); Kumaon, Kuttí Valley, in Byans, 4600 m, *J.F.Duthie 612* (E).

Closely allied to *J. allioides* but anthers shorter; caulin leaves acute to subobtuse, septa externally ±not visible, and rhizomes slender, creeping, so plant not tufted.

60. *Juncus glaucoturgidus* Noltie, *Edinburgh J. Bot.* 51: 132 (1994)

T: Sikkim, Samiti Lake (Bungmoteng Chho), 4300 m, 21 Jul 1992, [Anonymous: ESIK] 572; holo: E; iso: K.

Illustration: H.J.Noltie, *Edinburgh J. Bot.* 51: 133, fig. 1A–E (1994).

Perennials, 10–25 cm tall, densely caespitose; rhizome short-noded. Cataphylls numerous, dull, stramineous, darker at centre, paler at margins, minutely apiculate. Cauline leaf single, sub-basal, 5.5–12.5 cm long, shorter than stem, 2–3.5 mm in diam., suberect, glaucous, terete, hollow, constricted below the blunt apex, with few distant weak transverse septa not visible externally even when dry; sheath short, with minute auricles (less than 1 mm). Leaf-like bract on upper stem; sheath 3.5–5 cm long, tubular; apex with membranous subacute auricles to 2.2 mm long; blade bristle-like to 6.5 mm long. Non-flowering shoots with 1 leaf usually equalling stems and similar to stem leaf. Inflorescence a terminal c. (8–) 12–14-flowered capitulum to 2 cm in diam.; bracts forming an involucre-like structure, subequal, longest 15–22 × 7–8 mm, oblong-ovate, acute, dark reddish-brown, paler at margins. Flowers shortly (to 3 mm) pedicelled. Tepals subequal, cream; outer tepals 6.0–6.5 × 1.4–1.7 mm, oblong-lanceolate, subacute, keeled; inner tepals not keeled; anthers 2–3.4 mm long, narrowly oblong, pale yellow, exserted; filaments to c. 5–6 mm long, slightly shorter than tepals; ovary 2.5–3.0 × 1.2–1.9 mm, ellipsoid, abruptly contracted into 2.0–2.7 mm style; stigmas 1–1.5 mm long, stout, cream, erect. Capsule 4–4.5 × 2.5 mm, ellipsoid, golden brown; beak 1–1.5 mm long. Fig. 66.

JUNCACEAE (*Juncus*)

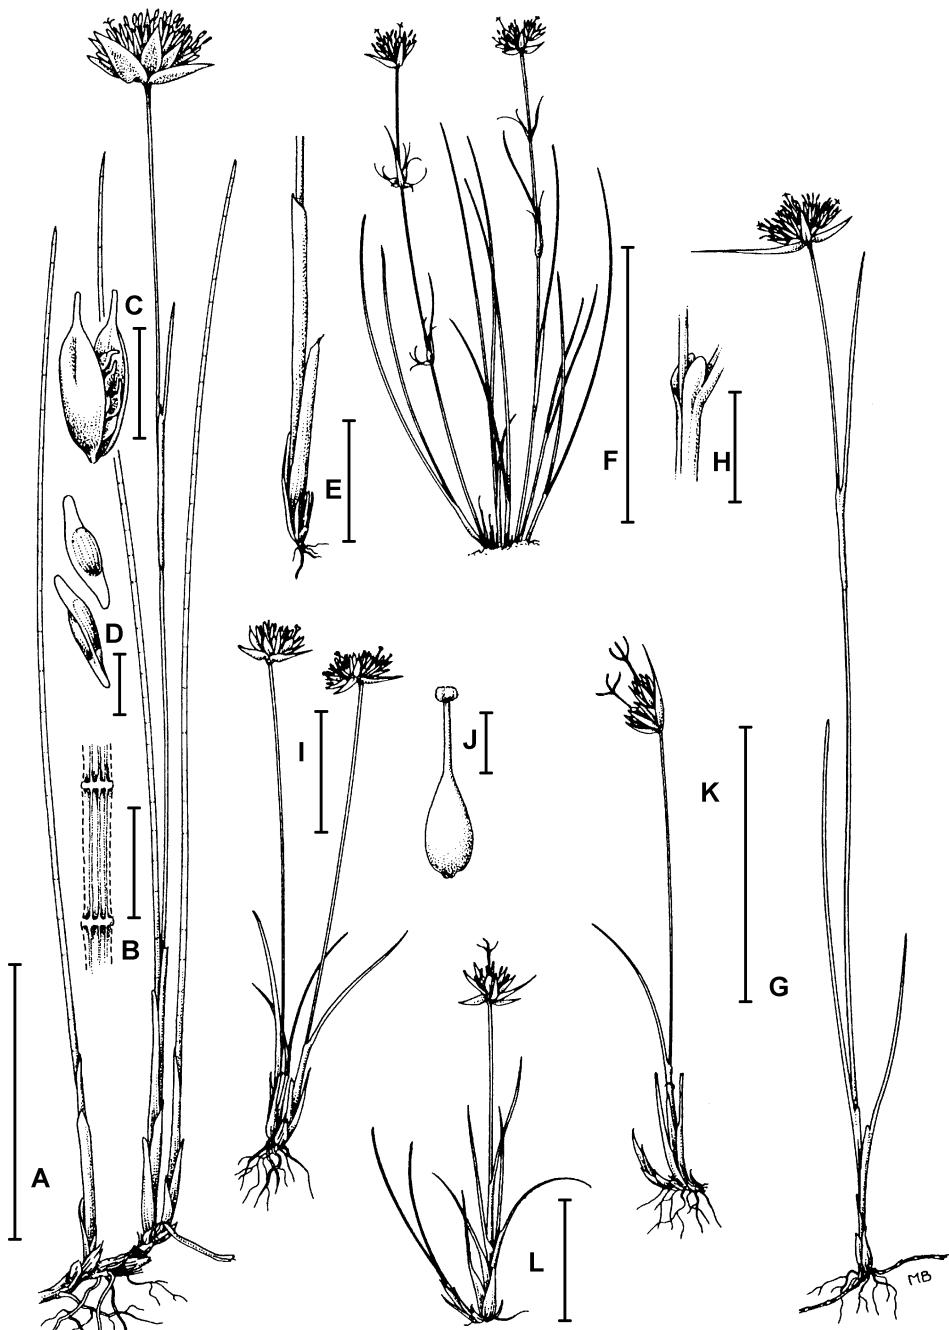

Figure 65. *Juncus allioides*. A, habit; B, leaf L.S. showing transverse septa; C, capsule; D, seeds. *Juncus leucanthus*. E, stem base showing sheathing scale leaves. *Juncus trichophyllus*. F, habit. *Juncus benghalensis*. G, habit showing slender stolons; H, leaf-sheath auricles of stem leaf. *Juncus brachystigma*. I, habit; J, capitate stigma. *Juncus duttiei*. K, habit. *Juncus uniflorus*. L, habit. Scale bars: A, F, G, K = 5 cm; B, H = 5 mm; C = 3 mm; D, J = 1 mm; E, I, L = 1 cm. Drawn by M.Bates. Reproduced by kind permission of the Trustees of the Royal Botanic Garden Edinburgh, from Noltie, *Fl. Bhutan* 3/1: 263, fig. 25 (1994).

Known from the E Himalayan region: Nepal, Bhutan, Sikkim. 40: EHM, NEP. Open subalpine meadow slopes, 3960–4300 m. Map 242.

40. EAST HIMALAYA: Bhutan, Kantanang, Tsampa, 4200 m, 3 Jun 1949, *F.Ludlow & G.Sherriff 19042* (BM). **NEPAL:** Kyangin Kharka, 3850–4500 m, 18 Jul 1967, *S.B.Malla 9197* (K).

Similar to *J. allioides*, but stems and leaves stouter; leaves glaucous, septa not visible externally; bracts broader.

61. *Juncus leucanthus* Royle ex D.Don, *Proc. Linn. Soc. London* 1: 10 (1839); & *Trans. Linn. Soc. London* 18: 318 (1840)

T: [not indicated in 1839; in 1840 given as] in Emodi montibus ad Shalma, *J.F.Royle*; lecto: LIV, designated here; isotype: K, LE, W.

Juncus leucanthus Royle ex D.Don var. *alpinus* Buchenau, *Bot. Jahrb. Syst.* 12: 396 (1890). T: Sikkim Himalaya, 4200–5150 m, *C.B.Clarke*; holo: K.

Juncus tanguticus Sam., in H.Handel-Mazzetti, *Symb. Sin.* 7: 1233 (1936). T: China, Hwangtou-schan, 10 Jul 1900, *G.Giraldi* 7242; holo: B, destroyed; iso: S.

Illustrations: H.J.Noltie, *Fl. Bhutan* 3(1): 263, fig. 25 (1994); Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 210, pl. 50 (1997).

Perennials, 8–32 cm tall, densely to loosely caespitose; rhizomes short-noded or ascending. Cataphylls up to 4, sometimes aristate, to 3 cm long, tightly encircling stem, castaneous, shining; sterile shoots with single leaf to 15 (–18) cm long; caudine leaves usually 2, stiffly erect, usually inserted $\frac{1}{2}$ and $\frac{2}{3}$ way along stem; lower leaf blade cylindric, sometimes flattened, to 10 cm long, to 1.4 mm wide, slightly grooved to deeply canaliculate, not septate, reaching at least base of upper leaf, sometimes exceeding inflorescence, gradually tapered to subacute apex; upper leaf with long slightly inflated sheath and short bristle-like blade to 2 cm long; auricles conspicuous, oblong, blunt, free part to 0.9–1.3 mm long, often brown. Lower 2 bracts subequal, equalling capitulum, lanceolate, dark castaneous, shining. Inflorescence hemispheric, 4–11-flowered, to 1.7 cm in diam.; pedicels of lower flowers to 3 mm long. Tepals lanceolate, subacute or inner blunt, \pm equal, 4.5–5.6 mm long, \pm white or reddish-brown. Stamens 6; anthers 2.0–2.9 mm long, usually completely exserted; filaments (2.2–) 4.2–5.2 mm long; ovary (1.5–) 2.2–2.5 mm long, abruptly contracted into 2.0–2.5 mm style; stigmas stout, short, erect, c. 0.3–0.6 mm long. Capsule ellipsoid-trigonous, 3.0–3.3 mm long, dark brown, shining; mucro 0.7–1.1 mm long (style with mucro c. 3 mm). Seeds pale brown, 0.7–0.8 \times 0.3–0.4 mm; appendages \pm unequal, 0.2–0.3 mm and c. 0.1–0.2 mm long. Fig. 65.

Garhwal, Nepal, East Himalaya, N Burma and SW China. 36: CHC, CHT. 40: EHM, NEP, WHM. 41: BMA. Scree and rocky slopes, open alpine heathland, damp flushes and *Rhododendron* scrub, usually between 3100 and 4600 m. Reported from North-Central China and Qinghai, but material not seen during this study. Map 243.

36. CHINA: Tibet, N of Pagri [Phari], Kang Me, 8 Aug 1882, *King's collector s.n.* (BM); Sichuan, Ta-tsien-lu [Kangding], Yülingkong, Gomba La, 3700 m, *H.Smith 10724* (S, UPS); Yunnan, Zhongdian, Wengsui to Xiang Chen, W side of Da Xue Shan pass, [*Anonymous: ACE*] 1851 (E); Yunnan, Zhongdian, Napa Hai, 3966 m, [*Anonymous: ACE*] 188 (E). **40. WEST HIMALAYA:** India, Uttar Pradesh, Mussorie, Kidar Kantha, 3850 m, *J.R.Drummond 22795* (K). **NEPAL:** between Tamo La and Sinion La, 4025 m, [*Anonymous: KEKE*] 677 (E, K, KATH); Rambrong, Lamjung, 4150 m, *J.D.A.Stainton, W.R.Sykes & R.H.J.Williams 6124* (UPS). **SIKKIM:** Jongri, 4150 m, *C.B.Clarke 26146* (K); Sikkim, Lachen, 3850 m, 20 Jun 1849, *J.D.Hooker* (K, LD). **BHUTAN:** Upper Mo Chu, Timuzam, W of Laya, 4150 m, *J.Sinclair & D.G.Long 5254* (K). **41. BURMA:** Kachin State, North Triangle (Tama Bum), 3500 m, *F.Kingdon-Ward 21018* (BM, p.p.).

Superficially similar to slender forms of *J. allioides* or *J. membranaceus* but differs in non-septate leaves and tightly sheathing castaneous cataphylls. Very similar to *J. cephalostigma* from which it differs in being more robust, with longer stigmas.

The isotype of *J. tanguticus* (*G.Giraldi* 7242) represents a plant very close to *J. leucanthus*. The main differences found between the typical *J. leucanthus* and the original material (incl. four paratypes) of *J. tanguticus* are: the lower caudine leaf almost sub-basal, straw-brown cataphylls \pm castaneous at base in the latter, the lower caudine leaf inserted in, or just below, the middle of stem; cataphylls dark castaneous in the former. The differences may be accounted for as extremes of the variation range of *J. leucanthus*, which we adopted above,

JUNCACEAE (*Juncus*)

Figure 66. *Juncus glaucoturgidus*. **A**, habit; **B**, flower; **C**, ovary; **D**, stigma; **E**, capsule. *Juncus bryophilus*. **F**, habit; **G**, flower; **H**, ovary; **I**, stigma; **J**, capsule; **K**, seeds. (A–E, ESIK 572, E; F, ESIK 698, E; G–K, J.Sinclair & D.G.Long 5217b, E). Scale bars: **A** = 3 cm; **B**, **C**, **E** = 5 mm; **F** = 1 cm; **G**, **H**, **J** = 1.7 mm; **D**, **K** = 1 mm; **I** = 1.5 mm. Drawn by M.Bates. Reproduced by kind permission of the Trustees of the Royal Botanic Garden Edinburgh, from Noltie, *Edinburgh J. Bot.* 51: 133, fig. 1 (1998).

or as a result of hybridization between *J. leucanthus* and *J. przewalskii*. Both these species, moreover, have white-flowered and reddish-brown-flowered forms. A part of the original material of *J. tanguticus* undoubtedly represents *J. przewalskii*. Further study is needed.

62. *Juncus spectabilis* Rendle, *J. Bot.* 44: 46 (1906)

T: Tibet, Gyantse, 1904, H.J.Walton 69; holo: BM; iso: K, photo E.

Perennials, 17–26 cm tall, loosely caespitose; rhizome creeping, thin; stems terete, c. 0.8–1.2 mm in diam. Cataphylls 1–2, brownish; margins distinct, castaneous-translucent; blade short, acicular. Basal leaves 1–2. Cauline leaf single, sub-basal, inserted in lower $\frac{1}{4}$ of stem, 2–5 cm long, to 0.8 mm wide, subterete, striate, pluritubular (up to three longitudinal septa), imperfectly septate; apex obtuse; sheaths 2–3 cm long, dilated above, with distinct castaneous-membranous margins; auricles distinct, \pm obtuse to truncate, c. 1 mm long, castaneous. Inflorescence bracts several, ovate-lanceolate, acute, castaneous-brownish, 0.7–1.0 cm long, one of them often leaf-like, with a dilated brownish sheath and short to c. 1 cm long blade slightly overtopping inflorescence, erecto-patent. Inflorescence a single c. 10–13-flowered terminal head; pedicels to 1.5–2 mm long. Tepals \pm equal, oblong-ovate, \pm cucullate at apex, c. 5.7–6.5 mm long, cream-white, keeled or 3-veined. Stamens 6, exserted; anthers 2.2–2.8 mm long; filaments to c. 8 mm long; style 1.0–1.5 mm long; stigmas 2–3 mm long; ovary c. 2.5 mm long. Young capsule distinctly mucronate, shorter than perianth, unilocular. Seeds not seen.

Known only from Tibet. 36: CHT. Ecology unknown. Map 244.

An imperfectly explored species, even missing from the recently published Flora of China [Wu Kuofang, *Fl. China* 13(3): 147–232 (1997)]. Up to now, the only gathering of *J. spectabilis* known is the type collection. The plants are somewhat intermediate between *J. triglumis* and *J. allioides*, and H.J.Noltie, *Edinburgh J. Bot.* 51: 131–132 (1994) considers a possibility of hybridization between the latter two species. From the closest species, *J. allioides*, it differs in lacking the middle cauline leaf and its leaf septa are not visible externally.

63. *Juncus cephalostigma* Sam., in H.Handel-Mazzetti, *Symb. Sin.* 7: 1233 (1936)

T: China, Yunnan, Tsekou on Mekong, Monbeig 43; syn: S.

Juncus leucanthus Royle ex D.Don var. *alpinus* Buchenau, *Bot. Jahrb. Syst.* 12: 396 (1890). T: Sikkim Himalaya, 4200–5150 m, C.B.Clarke; holo: K.

Juncus cephalostigma Sam. var. *dingjieensis* K.F.Wu, *Acta Phytotax. Sin.* 32: 460 (1994). T: Tibet, Dinggye [Gyangkar], 3650 m, 4 Jun 1975, [Exped. Qinghai-Xizang] 5484; holo: PE.

Illustration: Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 210, pl. 50 (1997).

Perennials, 6–20 cm tall, densely caespitose; rhizomes short. Cataphylls 1 or more, shortly aristate, tightly encircling stem, pale- to orange-brown; basal leaves 1 (–3). Cauline leaves usually 2, with lower one sub-basal and upper one $\frac{2}{3}$ way along stem. Lower leaf blade linear, to 8 cm long, 0.6–1.0 mm wide, cylindric, grooved above, sometimes also beneath, non-septate; apex \pm acute. Upper leaf with conspicuous, slightly inflated, often brownish sheath and short bristle-like blade to 0.8 cm long; auricles obtuse, free part c. 0.2 mm long, transparent, membranous, sometimes not visible. Lower 2 bracts subequal, lanceolate, ribbed when dry, scarcely exceeding capitulum, usually pale brown. Inflorescence hemispheric, 5–9-flowered, to 1.2 cm diameter, with flowers shortly pedicellate. Tepals narrowly lanceolate, \pm equal, 4.4–5 mm long, \pm white. Stamens 6; anthers 1.8–2.5 mm long, at least partly exserted; filaments 4–5.4 mm long; ovary ellipsoid, 2.3–2.8 mm long, abruptly contracted into 2.5–2.7 mm style; stigma capitate, pin-like, with exceedingly short lobes. Capsule broadly ellipsoid-trigonous, stramineous to brown, 2.3–2.8 mm long; mucro 0.9–1.2 mm long. Seeds c. 0.8 mm long; appendages short, c. 0.1–0.3 mm long.

East Himalaya, C and E Nepal, Sikkim, Bhutan, N Burma, China (Tibet, Yunnan). 36: CHC, CHT. 40: EHM, NEP. 41: BMA. Wet rocks, rocky meadows, 3350–4540 m. Map 245.

JUNCACEAE (*Juncus*)

36. CHINA: Yunnan, Mekong-Salwin divide, 28°12' N, 3840 m, *G.Forrest* 14252 (E p.p.); Yunnan, Zhongdian, Degen, Beima Shan, 4675 m, [*Anonymous: ACE*] 1277 (E). **40.** NEPAL: Arun Valley, Kasuwa Khola, 3850 m, *J.D.A.Stainton* 523 (E, UPS). SIKKIM: upper Sikkim, 3850–4800 m, *J.D.Hooker* (BM, S); Changu, 3850 m, *R.E.Cooper* 38 (BM, E). BHUTAN: Thrumse La, W of Sengor, 3640 m, *A.J.C.Grierson & D.G.Long* 2572 (E, K). **41.** BURMA: Kachin State, North Triangle (Tama Bum), 3500 m, *F.Kingdon-Ward* 21018 (BM p.p.).

Very close to *J. leucanthus*, but more slender and with capitate stigma.

64. *Juncus brachystigma* Sam., in H.Handel-Mazzetti, *Symb. Sin.* 7: 1236 (1936)

T: China, Yunnan, Ngulukö [Nguluke], Ndwo, 20 Jul 1914, *H.Handel-Mazzetti* 4259; lecto: WU, designated here; isolecto: W.

Illustrations: H.J.Noltie, *Fl. Bhutan* 3(1): 263, fig. 25 (1994); Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 200, pl. 47 (1997).

Perennials, 2–17 cm tall, densely caespitose; rhizomes very short. Cataphylls 1 or more, apiculate, brown. Cauline leaf usually 1 (–3), sub-basal, with upper $\frac{2}{3}$ of stem leafless; blade 0.2–5.0 cm long, to 0.8 mm wide, obtuse, canaliculate above and beneath, with up to 4 other shallower grooves, sometimes appearing bitubular in T.S.; auricles very short, with free part absent or c. 0.1 mm long. Lower bract ±equalling capitulum, or extended into aristate point to 3 cm long. Inflorescence 4–13-flowered, 0.7–1.0 (–1.4) cm diam.; pedicels short. Tepals narrowly lanceolate, ±equal, (3.0–) 3.5–3.9 (–4.5) mm long, ±white. Stamens 6; anthers finally completely exserted, 0.8–1.6 mm long; filaments elongating, c. 3–4 mm long; ovary ellipsoid, (0.9–) 2.2–2.8 mm long, abruptly contracted into exserted (0.9–) 1.3–1.8 (–2.8) mm style; stigmas up to 0.4 mm long, spreading or almost indistinct. Capsule castaneous, very shortly stipitate, narrowly ellipsoid, c. 3 mm long; mucro exserted, c. 0.8 mm long. Seeds brown, c. 0.3 mm wide, 0.5–0.7 mm long, or c. 0.9–1.1 mm including two appendages 0.1–0.2 mm long. Fig. 65.

In C Nepal, Sikkim, Bhutan, N Burma and China (Tibet, Yunnan). 36: CHC, CHT. 40: EHM, NEP. 41: BMA. Wet, usually calcareous rocks, damp patches amongst scrub, stony slopes, usually between 3050 and 5000 m. Map 246.

36. CHINA SOUTH-CENTRAL: Yunnan, Mekong-Salwin divide, 28°12' N, 3840 m, *G.Forrest* 14252 (E p.p.); Yunnan, Yulong Shan [Yulong Schan] near Likiang, Luoqu [Lökü], 3625 m, *H.Handel-Mazzetti* 6815 (S, WU); Yunnan, Likiang, Mt Ünlüpe, 4000–4200 m, *H.Handel-Mazzetti* 6706 (S, W, WU); Yunnan, Likiang Snow Range, 5150 m, *J.F.Rock* 5247 (S, W); Yunnan, Zhongdian, Wengsui to Xang Chen, W side of Da Xue Shan pass, [*Anonymous: ACE*] 1852 (E). **TIBET:** Kongbo Province, Molo, Nepar, 4000 m, *F.Ludlow, G.Sherriff & G.Taylor* 6266 (BM). **40.** EAST HIMALAYA: Sikkim, Na-tut, 26 Aug 1882, *King's collector s.n.* (K); Rookah, 3200 m, *King's collector s.n.* (K). NEPAL: Sabze Khola, 4300 m, *D.G.Lowndes* 1208 (BM); Rambrong, Lamjung, 4150 m, *J.D.A.Stainton, W.R.Sykes & R.H.J.Williams* 6160 (BM, E). **41.** BURMA, Imaw Bum, 3850–4150 m, *F.Kingdon-Ward* 3612 (E).

Similar to *J. cephalostigma* in its capitate stigma, but differs in lacking cauline leaf, and in lower bract extended into a leaf-like point.

65. *Juncus kingii* Rendle, *J. Bot.* 44: 45 (1906)

T: Tibet, N of Pagri [Phari], Kang-me, 3 Aug 1882, *King's collector s.n.*; lecto: BM, designated here; isolecto: K.

Juncus longibracteatus A.M.Lu & Z.Y.Zhang, *Acta Phytotax. Sin.* 17: 126 (1979). T: Tibet, Gyi-Lung, 4152 m, *Qing-Zang Exped. Group Q131-1*; holo: PE.

Illustrations: Lu An-min & Zhang Zhi-yun, *Acta Phytotax. Sin.* 17: 125, fig. 1, 5–8 (1979); Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 200, pl. 47 (1997).

Perennials, (6–) 13.5–35 cm tall, with stems single, distant, stiffly erect; rhizomes stout, creeping, long-noded. Cataphylls sheathing, with upper ones with setaceous points, whitish-brown, dull. Cauline leaf single, stiff, erect, linear; tip obtuse, usually $\frac{1}{2}$ of stem length, semicircular to cylindric in T.S., canaliculate, bitubular, with thin membranous longitudinal septum and weak transverse septa (septa not visible externally), to 1.7 mm wide; auricles rounded, with free part 0.8 × 0.9 mm, stramineous, membranous. Lower bract extended into leafy point at least twice capitulum length. Inflorescence 8–13 (–24)-flowered, 1.4–2.0 cm diam. Tepals narrowly lanceolate, acute, ±equal, 4.7–6.7 mm long, creamy white. Stamens 6; anthers completely exserted at maturity, 1.7–2.5 mm long; filaments elongating, to c. 5–6 mm

long; ovary ellipsoid, 2.0–4.2 mm long; style 1.3–2.7 mm long; stigmas 1.0–2.2 mm long. Capsule ellipsoid-trigonous, 3.0–4.1 mm long, abruptly contracted into partly exserted 1.5–2 mm mucro. Seeds orange-brown, to 0.3 mm wide, 0.6–0.8 mm long, or c. 0.9–1.0 mm including two subequal appendages c. 0.1–0.2 mm long.

From W Nepal to Sikkim, Bhutan, China (Tibet, Yunnan, Sichuan, Qinghai). 36: CHC, CHQ, CHT. 40: EHM, NEP. Wet meadows, along streams, stony slopes amongst scrub, 3600–4750 m. Map 247.

36. CHINA SOUTH-CENTRAL: Sichuan, Zado Valley W of Kanding, 3800 m, *Dickoré* 8200 (E); Yunnan, Zhongdian, Haba, E flank of Habashan, 4200 m, [Anonymous: ACE] 2120 (E). **TIBET:** Subamsir tributary, W of Xezar, 4160 m, *Dickoré* 10131 (E). **QINGHAI:** Nangqen Xian, 3600 m, *Ito, B.Bartholomew, Watson & M.Gilbert* 2977 (E). **40. Superficially similar to *J. allioides*, but distinguished by the elongate lower bract, creeping rhizomes, and lack of upper stem leaf.

66. *Juncus trichophyllus* W.W.Sm., Rec. Bot. Surv. India 6: 103 (1914)

T: Sikkim, Changu, 13,000 ft., 16 Jul 1910, *W.W.Smith* 3502; syn: CAL, K.

Illustration: H.J.Noltie, *Fl. Bhutan* 3(1): 263, fig. 25 (1994).

Perennials, 3–14 cm tall, caespitose; rhizome short, branched, clump-forming. Stems erect, terete, slender. Cataphylls stramineous to pale castaneous, later fibrous; basal leaves 0–2, filiform, bitubular, 0.5–1 cm long, c. 0.2–0.5 mm in diam. Cauline leaves 2–3, some inserted in upper part of stem, filiform, bract-like, 0.2–1.5 cm long; sheaths brown, enclosing small dark bulbils developing into plantlets; auricles oblique truncate, to c. 0.2 mm long, membranous or brownish. Bracts 2, navicular-lanceolate, 3–4 mm long, 1–1.5 mm wide, reddish-brown, shorter than perianth. Inflorescence reduced to a single terminal head with 1–3 (–5) flowers, yellowish white; bract lanceolate, pale brown; lowest bracts shorter than flower. Flowers 4–6 mm long, 0.7–0.9 mm wide; pedicels 0.8–1.3 mm long. Tepals narrowly ovate-lanceolate, acute, unequal; outer tepals shorter, 2.5–3.2 mm long, 0.7–0.9 mm wide; inner tepals to 3.3–3.7 mm long, ivory white. Stamens 6, exserted, 2.2–3.2 mm long; anthers linear elliptic, white, 0.8–1.5 mm long, shorter than 1.7–2.2 mm filaments; style 0.8–1.8 mm long; stigmas ±capitate, 0.2–0.3 mm long; ovary ellipsoid, 2.5–3.0 mm long, 0.8–1 mm wide, white. Capsule ellipsoid-trigonous, 2.6–3.1 mm long, 1.3–1.5 mm wide, with mucro to 0.5 mm long, brown, exceeding perianth, usually sterile. Seeds unknown. Fig. 65.

Confined to Nepal, Sikkim and Bhutan. 40: EHM, NEP. Wet flushes, boggy pool margins, mossy rocks, above 3500 m. Map 248.

40. EAST HIMALAYA: Sikkim [precise locality unknown], *King's collector* (K); Bhutan, Wangdi Phodrang District, Tintatso, 4300 m, *F.Miyamoto* 9361739b (TI). **NEPAL:** Koshi Zone, Sankhuwa Sabha District, Cha Ding Kharka-Khongma, 3900 m, *M.Minaki & al.* 9020862a (TI); Bagmati Zone, Rasuwa District, Kharka-Pati Kharka, 3650 m, *F.Miyamoto & al.* 9410194 (TI); Sagarmatha zone, Solukhumbu District, Pike, 3820 m, *F.Miyamoto & al.* 950059 (TI); Kauma, 3540 m, [Anonymous: EMAK] 294 (E); Sankhuwa Sabha District, opposite Shipton La, N side of Barum Khola, 4200 m, [Anonymous: EMAK] 653 (E).

A peculiar species notable for having dark bulbils in the axils of bract-like cauline leaves. According to the material available, it has ±sterile capsules.

JUNCACEAE (*Juncus*)

Perennials, 5–16 (–30) cm tall, densely caespitose; rhizome short. Stems erect, terete with several shallow grooves. Cataphylls 1–2, apiculate, reddish-brown. Leaves 2–3, basal and sub-basal, pluritubular at base, bitubular near apex, linear, 1–5 cm long; apex obtuse, reaching c. $\frac{1}{3}$ of stem; sheaths 1–4 cm long, often castaneous; auricles curved, acute, to c. 0.9 mm long. Lower bracts lanceolate to ovate, subequal, castaneous, not exceeding capitulum, usually 4–6 mm long. Inflorescence a single hemispherical 3–10-flowered head. Pedicels 0.5–2 mm long. Tepals ±lanceolate, subequal, 3–5 mm long, 0.7–0.9 mm wide, ivory-white. Stamens 6, exserted, 4–6 mm long; anthers linear elliptic, white, 1.2–2.0 mm long; filaments 2.5–4.2 mm long; style 0.5–0.8 mm long; stigmas 0.8–2.0 mm long; ovary 2–4 mm long, white. Capsules narrowly ellipsoid-trigonous, 3.8–5.0 mm long, 2–2.5 mm wide, with rostrum 0.6–1.0 mm long, castaneous-brown. Seeds oblong-ovoid, ochraceous, 0.6–0.8 × 0.2–0.3 mm, or c. 2.0–2.4 mm long including two appendages 0.6–1.1 mm long.

Maps: E. Hultén, Kongl. Svenska Vetenskapsakad. Handl., ser. 5, 8(5): map 42 (1962); N.K. Kovtonyuk, in L.I. Malyshev & G.A. Peshkova, *Fl. Sibiri* 4 (Araceae–Orchidaceae): map 31 (1987) [Siberia].

Perennials, 3–20 (–30) cm tall, loosely to densely caespitose, with short-noded rhizome and long thin subterranean stolons. Leaves basal, c. 2–8 cm long, or sub-basal with blade to c. 3–4 cm long, with uppermost leaf in lower $\frac{1}{3}$ – $\frac{1}{5}$ of stem, canaliculate at base, otherwise ±terete, c. 0.3–1.0 mm in diam., bitubular, not septate; apex subacute; sheath dilated with broad membranous to brownish or purplish margins; auricles to 1 mm long, obtuse, ±brownish. Lower bract blackish brown, brown or pale stramineous, oblong-ovate, obtuse to ±acute; apex scarious, usually shorter than perianth, c. 3.5–4.5 mm long. Inflorescence a single terminal cup-shaped (1–) 3–4 (–5)-flowered head; flowers arranged at the same level, or sometimes lower floret slightly remote. Tepals subequal; outer tepals often slightly longer, (3.5–) 4.0–5.0 (–5.5) mm long, acute to subacute; inner tepals subobtuse, blackish brown to brown, pale brown or stramineous. Stamens 6, ±equalling tepals; anthers 0.5–0.8 (–1.0) mm long; filaments c. 2.0–3.0 mm long; style 0.3–0.5 mm long; stigmas c. 0.5–1.0 mm long, ±patent. Capsule ±ellipsoid, subtrigonous above, subobtuse, usually (4.0–) 4.5–6.0 mm long, with c. 0.1–0.3 (–1.4) mm mucro, dark brown to stramineous, exceeding perianth. Seeds narrowly ellipsoid, to 1.0 × 0.3 mm, or to 2.8 mm long including two distinct appendages.

Subarctic to arctic regions and mountains of Europe, the Caucasus, Siberia, Mongolia, N China, the Far East and Korea, Greenland, North America. An extremely variable species with very variable chromosome numbers reported and many local variants, particularly in marginal or isolated parts of the range. The most conspicuous and most widely distributed race is recognized as a separate subspecies but numerous intermediates exist. Plants from the southern part of the Russian Far East, SE Siberia and North America are difficult to assign to

a subspecies [e.g., South Siberia, Chita, Darasun R., 7 Jun 1920, *G.Stukov* (BM, LE)]. The complex is in need of a revision.

Tepals blackish brown to pale brown; bracts usually brown; capsule usually longer than 4.5 mm, usually distinctly exceeding perianth; plants most often 7–15 cm tall; lower flower not or slightly remote

68a. subsp. *triglumis*

Tepals pale straw-brown to stramineous; capsule usually c. 4.0–4.5 mm long, scarcely exceeding perianth; plants taller, to 30 cm; lower flower often slightly remote

68b. subsp. *albescens*

Illustrations: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 230, fig. 106 (1906) as *J. sphenostemon*; H.J.Noltie, *Fl. Bhutan* 3(1): 263, fig. 25 (1994); Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 207, pl. 49 (1997).

Perennials, 5–24 cm tall, with single slender stems from thin creeping, long-noded rhizomes. Cataphylls 1 or more, whitish-brown. Cauline leaves usually 2 (–3); lower leaf basal, filiform, acute, canaliculate, bitubular, to 10 cm long, c. 0.7 mm wide; upper leaf usually present; blade to 8 cm, sometimes overtopping inflorescence; sheath long, sometimes slightly inflated and brown-tinged; auricles conspicuous, oblong, obtuse, with free part 0.7–1.2 mm long, usually brown. Lower bract developed into leaf-like point to 2.5 cm long. Inflorescence a single (2–) 4–11-flowered capitulum. Tepals cream-white to dirty white, narrowly lanceolate, subacute, equal, 4.0–5.8 (–6.5) mm long. Stamens 6; anthers very narrow, (1.7–) 2.2–3.3 mm long, exserted at maturity; filaments up to c. 5 mm long; ovary ellipsoid, 2.0–3.5 mm long; style 1.4–2.0 mm long; stigmas erect, (0.3–) 0.6–1.4 mm long. Capsule shortly stipitate, narrowly ellipsoid-trigonous, shorter than tepals, 2.6–4.0 mm long, tapered into 0.6–1.0 mm mucro. Seeds c. 0.6 mm long, or to 1.2 mm including two appendages. Fig. 65.

A common Sino-Himalayan species centred to the East Himalaya. It occurs from Swat, Pakistan, and Kashmir to Sichuan and Yunnan. Reported from Gansu, China, but specimens not located. 36: CHC, CHT. 40: EHM, NEP, PAK, WHM. River and stream banks, damp grasslands, damp gravelly banks and roadsides in *Abies/Rhododendron* forest, wet cliffs, sandy moraines, 2900–4570 m. Map 253.

Easily recognized by its elongate lower bract, conspicuous leaf sheath auricles and slender creeping rhizomes. Recently, a new species similar to *J. benghalensis* and *J. sherei* was detected in Dali, Yunnan, China. It is characterized by flat, grass-like leaves 0.8–1.6 mm wide, anthers 1.3–1.5 times as long as their filaments and the lower bract usually shorter than inflorescence. F.Miyamoto and H.Ohba call it *Juncus petrophilus* (the description submitted to *J. Jap. Bot.* in 2000).

71. *Juncus perpusillus* Sam., in H.Handel-Mazzetti, *Symb. Sin.* 7: 1237 (1936)

T: China, Sichuan, Taofu [Dawu], Haitzeshan, 4400–4600 m, 31 Aug 1934, *H.Smith* 11684; holo: UPS; iso: BM, S.

Perennials; stems 1.5–8 cm, setaceous, densely caespitose; rhizomes very short, stout, covered with dark brown scales. Leaves bitubular, filiform; leaf sheaths with conspicuous, often reddish-brown auricles; upper stem leaf present or absent; basal stem leaf with dark purplish-brown sheath. Bracts castaneous, with lowermost often with leaf-like point exceeding inflorescence. Inflorescence a single (1–) 2–4-flowered capitulum. Tepals 3.0–4.5 × 1 mm, oblong, obtuse, initially white, becoming suffused dark purplish. Stamens 6; anthers 1.5–2 mm long; filaments up to 3.5–4.5 mm long, exceeding tepals at maturity; style 0.7–1.2 mm long; stigmas c. 0.5 mm long, spreading. Capsule 2.5–3 × 1.5–2 mm, oblong-ellipsoid, abruptly contracted into 1.0–1.5 mm mucro. Seeds 0.6–0.7 mm long, with minute appendages less than 0.1 mm long.

A rare, probably overlooked, species recorded from Nepal, Sikkim, Tibet and Sichuan, China. 36: CHC, CHT. 40: EHM, NEP. Shallow, damp soils on moraines, above 4250–5020 m. Map 254.

36. TIBET: SW of Lhozak [Lhozhag, Garbo] Valley junction, 4420 m, *Dickoré* 9816 (E); Tsangpo – Subansiri Pass, 5000 m, *Dickoré* 9952 (E). **40.** EAST HIMALAYA: Sikkim, Chaurikhang, foot of East Rathong Glacier, 4550 m, [*Anonymous: ESIK*] 375 (E); SE side of Lasha Chhu, below Sebu La, 4700 m, *D.G.Long & H.J.Noltie* 383 (E). NEPAL: Gosainkund Lake, 4250 m, *T. de Haas* 2252 (BM); rocks N of Gosainkund Governmental House, 4500 m, *T. de Haas* 2222 (BM); Lau, 4600 m, *Yon* 243 (BM).

Close to *J. benghalensis*, especially in its bitubular leaves, the usually long, leaf-like lowest bract and the conspicuous leaf-sheath auricles, but differing in its very dwarf stature (inflorescence sometimes reduced to 1 or 2 flowers) and its short, branched rhizomes giving rise to dense clumps, rather than having stems borne singly and spreading by very slender rhizomes.

72. *Juncus concolor* Sam., in H.Handel-Mazzetti, *Symb. Sin.* 7: 1232 (1936)

T: Yunnan, zwischen Dschaoping und Boloti'n von Yungbei [Yongsheng], 2600–3000 m, 30 Jun 1914, *H.Handel-Mazzetti* 3359; holo: W.

Illustration: F.Miyamoto & H.Ohba, *J. Jap. Bot.* 74: 73, fig. 1 (1999).

Perennials, 10–38 cm tall, loosely caespitose; rhizome thin, creeping, 0.3–0.7 mm across. Stem erect, terete. Cataphylls 3–6, 1.6–4.0 cm long, stramineous, dull; basal leaves absent. Cauline leaf single, inserted in upper half of stem, terete, unitubular, usually exceeding stem, 10–21 cm long, 1.0–1.5 mm wide; sheath 1.0–3.0 cm long, grass-green; auricles very short, obtuse. Bracts 3–5, with lower one shorter than the flowers, lanceolate, 7–9 mm long, 3.4–4.3 mm wide, light brown. Inflorescence a terminal semiglobose, 5–20-flowered head 1.0–2.0 cm wide; flower bract lanceolate, 3.0–9.0 mm long, 0.7–4.3 mm wide, light brown. Flowers 6.5–9.5 mm long, 2.0–2.5 mm wide; pedicels 0.8–2.4 mm. Tepals ±equal, lanceolate, acute, 4.8–5.5 mm long, 1.2–1.5 mm wide, ivory-white. Stamens 6, long exserted, 7.3–8.7 mm long; anthers linear-elliptic, 2.5–2.8 mm long, ivory-white; filaments 4.8–6.0 mm long; style 2.3–3.5 mm long; stigmas 0.6–0.9 mm long; ovary ovoid-trigonous, 2.5–4.0 mm long, 1.0–1.4 mm wide. Seed unknown. Fig. 68.

Only known from Yunnan, China. 36: CHC. On grassland slopes, above 3400 m. Map 255.

36. CHINA SOUTH-CENTRAL: Yunnan, Yangbi, around Cangshan, 3800 m, *S.K.Wu & al.* 475 (KUN, TI); Yunnan, Y. Cheng Kang, Snow Range, 3400 m, *Yu* 1961 (PE).

Juncus concolor is similar to *J. allioides*, *J. cephalostigma*, *J. glaucoturgidus*, *J. leucanthus* and *J. trachyphyllus*, but it apparently differs in having a stoloniferous rhizome, no basal leaf, and stramineous basal sheath.

73. *Juncus przewalskii* Buchenau, *Bot. Jahrb. Syst.* 12: 398 (1890)

T: China, [Gansu] Terra Tangutorum (prov. Kansu), regio alpina securis fl. Tetung (affl. Hoangho), Jul 1872, *N.M.Przewalski s.n.*; syn: W, S.

Juncus przewalskii var. *discolor* Sam., in *H.Handel-Mazzetti, Symb. Sin.* 7: 1234 (1936). T: China [Yunnan, Yangtze watershed], Likiang, E slopes of Likiang Snow Range, 15,000 ft., v–x.1922, *J.F.Rock* 4953; syn: B., n.v.

Juncus kangdingensis K.F.Wu, *Acta Phytotax. Sin.* 32: 460 (1994). T: China, Sichuan, Kangding, 3400 m, 1934, *Zhen-shu Liu* 964; holo: PE.

Illustrations: F.G.P.Buchenau, in *H.G.A.Engler, Pflanzenr.* (iv.36) 25: 231, fig. 108 (1906); Wu Kuofang, *Fl. R. P. Sinicae* 13(3): 216, pl. 51 (1997).

Perennials, 3–28 cm tall, densely caespitose; rhizome short, densely branched. Stem erect, terete, 0.2–0.5 mm thick. Cataphylls 1–3, pale castaneous, to c. 3 cm long; basal and subbasal leaves 1–3, unitubular, indistinctly septate, 2–11 cm long, 0.6–1.0 mm in diam. Cauline leaf 1, inserted in upper $\frac{1}{2}$ – $\frac{1}{4}$ of stem; blade reduced, 0.5–2 cm long, thin; sheaths tight, c. 1.5–2.5 cm long, with dark castaneous margins, sometimes entirely castaneous; auricles obtuse to truncate, 0.5–1.3 mm long, dark castaneous or distally scarious. Bracts ovate, ±acute, (4–) 6–8 (–10) mm long, deep castaneous-brown, usually with paler to

74. *Juncus sherei* Miyam. & H.Ohba, *J. Jap. Bot.* 72: 293 (1997)

T: Nepal, Sagarmatha Zone, Solukhumbu District, Gnaula – Pike, 3300 m, 22 Jul 1995, *F.Miyamoto & al. 9580049*; holo: TI.

Illustration: *F.Miyamoto & H.Ohba, J. Jap. Bot.* 72: 294, fig. 1 (1997).

Perennials, 6–19 cm tall, caespitose; rhizome very short. Stem erect, terete. Cataphylls 2–3, loose, brown; basal leaves \pm bitubular, grooved on both adaxial and abaxial sides, 2–11 cm long; leaf sheath 1–4 cm long. Cauline leaves absent, sometimes single, inserted in lower or upper part of stem, linear, 1.5–3.0 cm long, not exceeding inflorescence; auricles obtuse, 0.7–1.0 mm long. Lower bract exceeding inflorescence, acicular-lanceolate, 0.5–1.5 cm long, 1–2 mm wide, brownish green. Inflorescence a single terminal hemispherical head, usually 3–7-flowered, 1.0–1.5 cm wide; flower bracts lanceolate, 2–4 mm long, 0.5–2 mm wide, brown. Flowers 4–8 mm long, 6–12 mm wide; pedicels 0.3–0.5 mm long. Tepals \pm equal, lanceolate, subacute, 3–6 mm long, 1–1.7 mm wide, white, later whitish-stramineous. Stamens 6, exserted, 5.8–8.8 mm long; anthers linear-elliptic, white, (1.2–) 1.8–2.5 mm long, twice as long as 4.0–6.1 mm filaments; style 1.3–1.8 mm long; stigmas 0.6–0.8 mm long. Capsule unilocular, narrowly ovoid-trigonous, acuminate, rostrate, 3.0–4.0 mm long incl. 0.6–1.1 mm rostrum, 1–1.5 mm wide, castaneous-brown, shining. Seeds [the Bhutan specimen] ellipsoid, 0.5–0.6 \times 0.2 mm, or c. 0.8 mm including two minute appendages c. 0.1 mm long.

Nepal, East Himalaya (Bhutan) and Yunnan, China. 36: CHC. 40: EHM, NEP. Alpine scree slopes and banks, above 3000 m. Map 257.

75. *Juncus gonggae* Miyam. & H.Ohba, in F.Miyamoto & al., *J. Jap. Bot.* 72: 162 (1997)

T: China [China South-Central], Sichuan, Daocheng District, Mt Gonggashan, 4300 m, 25 Aug 1996, S.K.Wu & al. 1551; holo: KUN; iso: TI.

Illustration: F.Miyamoto & H.Ohba, *J. Jap. Bot.* 72: 163, fig. 1 (1997).

Perennials, 4–20 cm tall, densely caespitose; rhizome short. Stem ±erect, terete, grooved. Cataphylls 1–3, brown. Leaves basal and subbasal, 1–2, bitubular, canaliculate, 1.5–10 cm long; sheaths 0.5–2 cm long, stramineous, with leaves of sterile shoots with several grooves, 1.2–15 cm long. Cauline leaf absent or single, linear, 3–5 cm long; auricles obtuse, 0.5–0.7 mm long, ±scarious. Lower bract equalling or slightly exceeding inflorescence, linear-lanceolate, 4–10 mm long, 0.5–1.0 mm wide, light brown. Inflorescence a terminal 3–8-flowered head; flower bracts lanceolate, 1.5–2.0 mm long, 0.5–0.8 mm wide, light brown. Flowers proliferating or not so, sometimes mixed in an inflorescence; normal flowers on pedicels 0.4–0.6 mm long. Tepals ±equal, lanceolate, subacute, 3.0–3.5 mm long, 0.8–1.1 mm wide, ±white. Stamens 6, exserted, 4.5–5.0 mm long; anthers linear, white, 1.2–1.3 mm long; filaments 3.8–4.0 mm long; style 0.4–0.8 mm long; stigmas 0.5–0.7 mm long. Capsule unilocular, ±ovoid-trigonous, acuminate, 2.9–3.0 mm long, 1.0–1.2 mm wide, castaneous-brown, slightly exceeding perianth. Proliferating flowers 3–5 mm long, stamens and capsules usually abortive, with inner perianth segment changed into propagules 3.0–4.5 mm long. Seeds ellipsoid, apiculate, brown, 0.5–0.6 mm long; appendages ±absent. Fig. 70.

Known from the type locality in Sichuan, SW China. 36: CHC. On banks and scree slopes, above 3500 m. Map 258.

Juncus gonggae is similar to *J. modicus* but differs by short anthers and the grooved leaves. The plants often have proliferating flowers. In the section *Stygiopsis*, proliferation has been known in *J. trichophyllum*, *J. harae* and *J. dongchuanensis*. *Juncus trichophyllum* differs from *J. gonggae* in having axillary bulbils on cauline leaves.

76. *Juncus trachyphyllus* Miyam. & H.Ohba, in F.Miyamoto & al., *J. Jap. Bot.* 72: 164 (1997)

T: China, Sichuan, Daocheng District, Mt Gonggashan, 4300 m, 21 Aug 1996, S.K.Wu & al. 1540; holo: KUN; iso: TI.

Illustration: F.Miyamoto & H.Ohba, *J. Jap. Bot.* 72: 165, fig. 2 (1997).

Perennials, 7–20 cm tall, densely caespitose; rhizome short. Stem erect, terete, scabrous. Cataphylls 1–3, brownish; basal leaves terete, grooved, scabrous, 2–4-tubular, 4–10 cm long; sheath 1.0–3.5 cm long, stramineous. Cauline leaf 1, terete, with an adaxial groove, 1.5–7.0 cm long, not exceeding inflorescence; auricles absent. Lower bract subterete, exceeding or equalling inflorescence, 0.8–1.2 cm long, 2.0–3.5 mm wide. Inflorescence a single terminal hemispherical head, 5–15-flowered, 0.8–1.5 cm wide, or rarely heads two with lateral one on peduncle 1.0–1.5 cm long; sheath-like bract present; flower bracts membranous, lanceolate, 3–4 mm long; capitulum bracts lanceolate-ovate, 4–7 mm long, 1.5–3.0 mm wide, light brown. Flowers 0.7–1.0 cm long; pedicels 0.8–1.0 mm long. Tepals subequal; inner tepals slightly longer, 4.5–5.5 mm long, 1.0–1.4 mm wide, ±white, lanceolate, acute to subacute; outer tepals 4–5 mm long, 0.9–1.0 mm wide. Stamens 6, exserted, 9–10 mm long; anthers linear, white, 2.5–3.8 mm long; filaments 6.5–7.2 mm long; style 2.0–2.5 mm long; stigmas 0.6–0.8 mm long. Capsule unilocular, ovoid-trigonous, acuminate, 4.4–4.8 mm long, 1.2–1.5 mm wide, with rostrum exceeding perianth. Seeds ellipsoid, apiculate, 1.5–1.8 mm long; appendages ±absent. Fig. 71.

Known from Gonggashan, Sichuan, SW China. 36: CHC. On alpine scree slopes, above 4000 m. Map 259.

36. CHINA SOUTH-CENTRAL: Sichuan, Daocheng District, Mt Gonggashan, alt. 4000 m, S.K.Wu & al. 1579 (KUN, TI).

Juncus trachyphyllus is similar to *J. allioides* and *J. glaucoturgidus* but differs in having scabrid leaves and stems and adaxially grooved basal leaves. The scabrid leaves (under
